Building the Evidence Base on Urban Transport

Interim Results from ADB-Supported Impact Evaluations
in Lahore, Pakistan

Kate Vyborny

Duke University

April 2018

Motivation

- ▶ Rapid urban growth and increase in private vehicle use: **environmental concern**
- ▶ Poor have limited access to cars or public transport; public transport often low quality (speed, reliability, safety): **equity concern**
- ▶ In Pakistan, women even more constrained because of social norms and safety: **gender equity concern**
- ▶ Major **mass transit expansion** in progress across Pakistan

Two impact evaluations on urban transport in Lahore, Pakistan, conducted by academic research team and supported by ADB:

- ▶ **Mass transit line (quasi-experiment)**
- ▶ **Pick-and-drop to work, with gender focus (randomized experiment)**

Work in progress

- ▶ Some results presented in public documents - for circulation
- ▶ Other results are work in progress and subject to change
- ▶ Comments welcome - katherine.vyborny@duke.edu

Impact evaluation 1: Mass transit

- ▶ Joint work with Hadia Majid (Lahore University of Management Sciences) and Ammar Malik (Urban Institute)
- ▶ Working paper available online: “Infrastructure investments and public transport use: Evidence from Lahore, Pakistan”

Background

- ▶ Mass transit project highly controversial: need for **independent evidence**
- ▶ Completed study focuses on switch to **sustainable commuting**, i.e. commuting by public instead of private vehicle
- ▶ Ongoing study explores impact on **other economic outcomes**: markets for labor (workers, jobseekers, firms, small businesses) and land (real estate prices, density)

Literature

- ▶ Literature on **U.S. mass transit investments** (Baum-Snow and Kahn 2000 JPE, 2005, Winston and Maheshri 2007 JUE):
 - ▶ Are built in **lower-income areas**
 - ▶ Have **limited impact** on **public transport ridership**; most users switch from buses
 - ▶ Do **not justify** capital costs of rail
- ▶ More limited evidence from developing world, where:
 - ▶ **Larger base** of potential public transport users
 - ▶ **Congestion higher** so greater time savings relative to travel in car or bus

Our contribution

- ▶ Challenge of isolating **cause and effect**: government targets transport to areas that might be different for other reasons
- ▶ Isolate effects of metrobus with **quasi-experiment** using **similar areas** served by **planned lines** as comparison group
- ▶ Detailed **microdata on comparable areas**
- ▶ Complement with rich **descriptive data** from household and rider surveys

2007 Lahore mass transit plan

Lahore Transit:
Implemented and Cancelled Routes

2013 metrobus (green line) crosses entire city N-S

2013 metrobus (green line) crosses entire city N-S

2016-present: orange line under construction

Lahore Transit: Implemented and Cancelled Routes

Quasi-experiment plus matching

- **Planned lines** are used as **comparison group**
- **Avoid spillovers:** C zones at min distance from T1 / T2 stops

Matched sub-sample

- ▶ Select zones **similar on observables** at baseline
 - ▶ 2010 data (labor, income, commute, demographics), 1998 census data (pre-trends), characteristics of surrounding zones[▶ Details](#)
- ▶ **Well-balanced** after matching [▶ Table](#)

“Donut” fixed effects

Built (T1) station

Planned (T2) station

Cancelled (C) station

Identifying assumption for causal effect

- ▶ Areas at **same distance to a planned stop and a built stop** with **same characteristics at baseline** do not differ on unobservables that affect commuting
- ▶ Robustness to recall-based panel: **parallel trends** within this matched quasi-experimental group

Data

- ▶ Causal effect: **Matched comparison groups:**
 - ▶ 12,000 **HHs**
 - ▶ 500 **real estate agents** / community respondents
- ▶ Descriptive analysis: Representative survey of 2,400 **Metrobus riders**

Empirical specification

- ▶ X of interest: **Public transport access** reported by community respondent: “How long does it take to get from here to Kalma Chowk using only walking, bus, wagon or metrobus?”
- ▶ Use **distance to built stop** as an **instrument for public transport accessibility to central Lahore**

Empirical specification

$$ACCESS_{gt} = \pi_1 + \pi_2 D1 + \pi_3 D1POST_t + \pi_4 D + \pi_5 DPOST_t \\ + \eta Z_g \cdot POST_t + v_{gt}$$

$$Y_{igt} = \beta_1 + \beta_2 \widehat{ACCESS}_{gt} + \beta_3 POST_t + \pi_4 D + \pi_5 DPOST_t \\ + \gamma X_i \cdot POST_t + \zeta Z_g \cdot POST_t + \epsilon_{igt}$$

- ▶ *ACCESS*: fastest available route on public transport from area *g* to Kalma Chowk
- ▶ *D1* distance to built stop (T1)
- ▶ *D* distance to any planned stop (T1, T2, C)
- ▶ *X_i* individual control variables
- ▶ *Z_g* group control variables including the “donut rings”
- ▶ Cluster ϵ at the zone level

Results: public transport access

On average, each km closer to a transit stop:

- ▶ decreases travel time to center on public transport by 3.5 min
- ▶ decreases travel fare to center on public transport by 3 PKR

Transit targeted at higher SES areas

Transit targeted at higher SES areas

- ▶ Contrast to US where transit targeted at low income areas
- ▶ Likely related to proximity to major roads where transit feasible

Transit draws higher SES riders than buses

Transit draws more women riders than buses

Transit draws riders from far away

Transit draws riders from far away

Transit riders report switching from private transport

Transit riders report switching from private transport

Results: switching to public transport

Causal results (regression estimates):

- ▶ Transit caused **significant switch to public transport**
- ▶ For areas with faster access to central Lahore via Metrobus, every **10 minute increase in public transport access to center** increases the number using public transport by 1.3 percentage points, or about **20% increase** over base of 7%
- ▶ Estimate **35,000 switchers overall**
- ▶ Most switch from **motorbikes**
- ▶ Estimate about **6,000 tons CO2 averted per year** from switching

Riders willing to pay much higher fares

Conclusions on targeting and public transport use

- ▶ Metrobus attracted **more high SES riders and more women**
- ▶ Mass transit caused **significant switch from private to public transport**
- ▶ Riders are willing to pay substantially more; **subsidy could be better targeted**

Economic activity: **work in progress**

- ▶ Increase in **rents** in high density areas
- ▶ Increase in **urban density** near stations
- ▶ **No change** in **overall workforce participation**
- ▶ Increase in activity of small **local businesses near stations**
- ▶ Ongoing work: using firms survey and jobs matching platform to study firm and worker impacts in more detail: data on **firm-worker match quality** to separate **overall gains vs. change in spatial pattern of activity**

Impact evaluation 2: Transport randomization

- ▶ Joint work with Erica Field (Duke University)
- ▶ Policy brief from first phase available online: “Overcoming Barriers to Women’s Mobility: Improving Women’s Access to Public Transport in Pakistan”

Few women work, but many women say they **want to work**

Getting to work is one of the major challenges

“ Sometimes men follow me to the bus stop - that's just how things are!

- Worker, garment factory, Kot Lakhpat, Lahore ”

Getting to work is one of the major challenges

Female opinions on safety for women at night
on alternative transport modes

Women say transport affects their choice of jobs

“ “The factory I worked at before did not offer me conveyance, so coming and going from home to work was very problematic for me. That's why I changed my job to this one.

- Worker, garment factory, Kot Lakhpat, Lahore” ”

Women say transport affects their choice of jobs

Def. Willing to Work = 2822, Willing to Work = 3266, Indifferent = 3532,

Only a few larger employers provide transport

Policy brief on gender and mobility in Pakistan - from background work to IE

Policy brief (“Overcoming Barriers to Women’s Mobility” - CDPR):

- ▶ Extend **high-quality public transport** with less crowding
- ▶ **Make streets safer for women:** police, night lights
- ▶ Continue and evaluate efforts to **normalize women in public space** (“women on wheels”)
- ▶ Train and monitor transport staff on **harassment**

Randomized Controlled Trial

- ▶ **Baseline surveys** of men, women and employers
- ▶ Designate routes:
 - ▶ Group 1: **female-only** pick and drop services
 - ▶ Group 2: **mixed-gender** pick and drop services
 - ▶ Group 3: **“Control” routes** for comparison
- ▶ Provide **pick-and-drop for one year**

Phase II: Randomized Controlled Trial

- ▶ **Follow-up survey:** did service improve outcomes for **male, female jobseekers and employers?**
- ▶ Test and evaluate **one approach:** if successful, could be scaled up and form part of the solution
- ▶ Quantify potential economic benefits of **all policies** that can improve mobility (not just pick / drop)

Design

Differential effect of involving women's-only transport on women

Treated residential areas: Women's-only transport

Residential areas transport: Mixed-gender transport

Treated residential areas: Mixed-gender transport

Measurement strategy

- ▶ Measure whether men / women **apply to and get better jobs further from home**
- ▶ Measure whether firms have access to a **better pool of employees**
- ▶ Research team developed “**Job Talash**” (Job Search) service
- ▶ Offered to all HHs and employers at baseline

Strong interest in Job Talash - urban and periurban

Interest across gender and ed; increasing in ed for women

Employers are spread across metro area

Field survey representative of all employers

Firms of all sizes want Job Talash to send candidates

Most firms have no women...

... but are willing to hire them

Approach 1 and 2 pilots

Potential matches across gender and education

Subscribers apply to 15% of proposed matches

Subscribers apply to 15% of proposed matches

Unit of observation is applicant-job, for potential job matches passing initial qualifications screener.
Last Updated: 10 Apr 2018 with No. of Observations: 8915

Screening and skills testing

- ▶ Does the intervention **improve matching** or do treated women displace other similar women?
- ▶ Firm randomization: test effects on **hiring and composition**
- ▶ Offer free HR services: **test and score** applicants
- ▶ Test directly for effects on **pool quality**
- ▶ **91% of employers** surveyed express interest in screening service

Screening and skills testing

Transport intervention offer through Job Talash

- ▶ **Transport RCT underway:**
offers sent for first 50 jobs to pilot subsets of T1, T2 and C
- ▶ Initial results soon on **applications** and **hiring**

Transport intervention offer through Job Talash

Scale up - test impacts on:

- ▶ **Applications**
- ▶ **Hiring**
- ▶ **Location** - apply to and take up work further from home?
- ▶ **Composition** for firms
- ▶ **Pool quality** (with testing services)
- ▶ **Norms**: acceptability of women's work, mobility, gender segregation

Supplementary slides

Takeup of green line for daily commute

	(1)	(2)
Distance to closest built stop (T1)	-0.001*** (0.000)	-0.003*** (0.001)
Distance to closest stop (T1 / T2 / C)	0.000 (0.001)	0.000 (0.001)
Distance to closest built stop sq		0.000*** (0.000)
Distance to closest stop sq		-0.000 (0.000)
Constant	0.146*** (0.051)	0.047 (0.054)
Observations	48106	48106
Sample mean dependent variable		0.010

Each observation is one adult HH member in year 2015-6. All specifications include controls for female, age, age squared, years of education and years of education squared.

Matching variables

- ▶ Distance to center
- ▶ Punjab Directory of Industries: Number of manufacturing firms, weighted by distance; total firm investment, weighted by distance
- ▶ Population density
- ▶ 2010 government survey: Income; Education; Trip cost and duration; Years at location; Owns house; Rent; House area; Number of rooms; Monthly transport expenditure; Vehicle ownership; HH size
- ▶ To address **pre-trends**, 1998 census: education (primary male, primary female, matric male, matric female), demographics (proportion age 10 or older, 18 or older), proportion religious minorities
- ▶ HH and individual variables for **neighboring** zones

Matching method

Construct Mahalanobis distance on vector of baseline characteristics between each C zone and corresponding potential T1 zones:

$$D_M(x) = \sqrt{(x_i - x_j)' S^{-1} (x_i - x_j)}$$

Where

- ▶ x_i and x_j are baseline characteristics of a C and T1 zone
- ▶ S is their covariance matrix
- ▶ Select pairs of C and T1 zones with a given maximum D_M
- ▶ Repeat for C-T2 matches
- ▶ Select C zones that have at least one matching T1 and one matching T2 zone
- ▶ Multiple matches allowed; use weights to correct for this

Balance after matching (2010 government survey)
