

A close-up photograph of an elephant's trunk and tusk. The trunk is thick and wrinkled, with a small hole at the tip. The tusk is long and curved, showing some wear and a lighter color at the tip.

Seeking Long-Term Persistence of Asian Elephants and Tigers in a Connected Landscape

Globally Important Conservation Area

- **Biodiversity Hot Spot**, located in the Western Ghats (Mittermeier *et al.* 1999)
- **Three of the Global 200 Eco-regions** found here (Olson and Dinerstein, 2002)
- **World's largest Asian elephant population** an estimated 8600 elephants (MoEFCC, 2012)
- **World's largest tiger population**, 382 (95% CI 354 – 411) tigers (Jhala *et al.* 2011)
- **India's first Biosphere Reserve**

What makes it so good - strengths

- Large landscape (~ 15,000 km of connected forests)
- Large breeding populations which are genetically viable for long term conservation.
- Diverse resources accessible to large mammals
- Large interconnected PAs network and Reserve Forests

Economically Important Area

- **Ecosystem services**
- **Watershed for Cauvery and other Rivers** (water for Industrial, agricultural and drinking purposes)
- **Hydropower** - 34% of Tamil Nadu's Hydropower comes from the Nilgiris
- **Climate moderation and carbon sequestering**
- **Genetic storehouse** - wild relatives of cultivar species and medicinal plants
- **Home to forest dependent Tribal people**

Railway accidents involving elephants

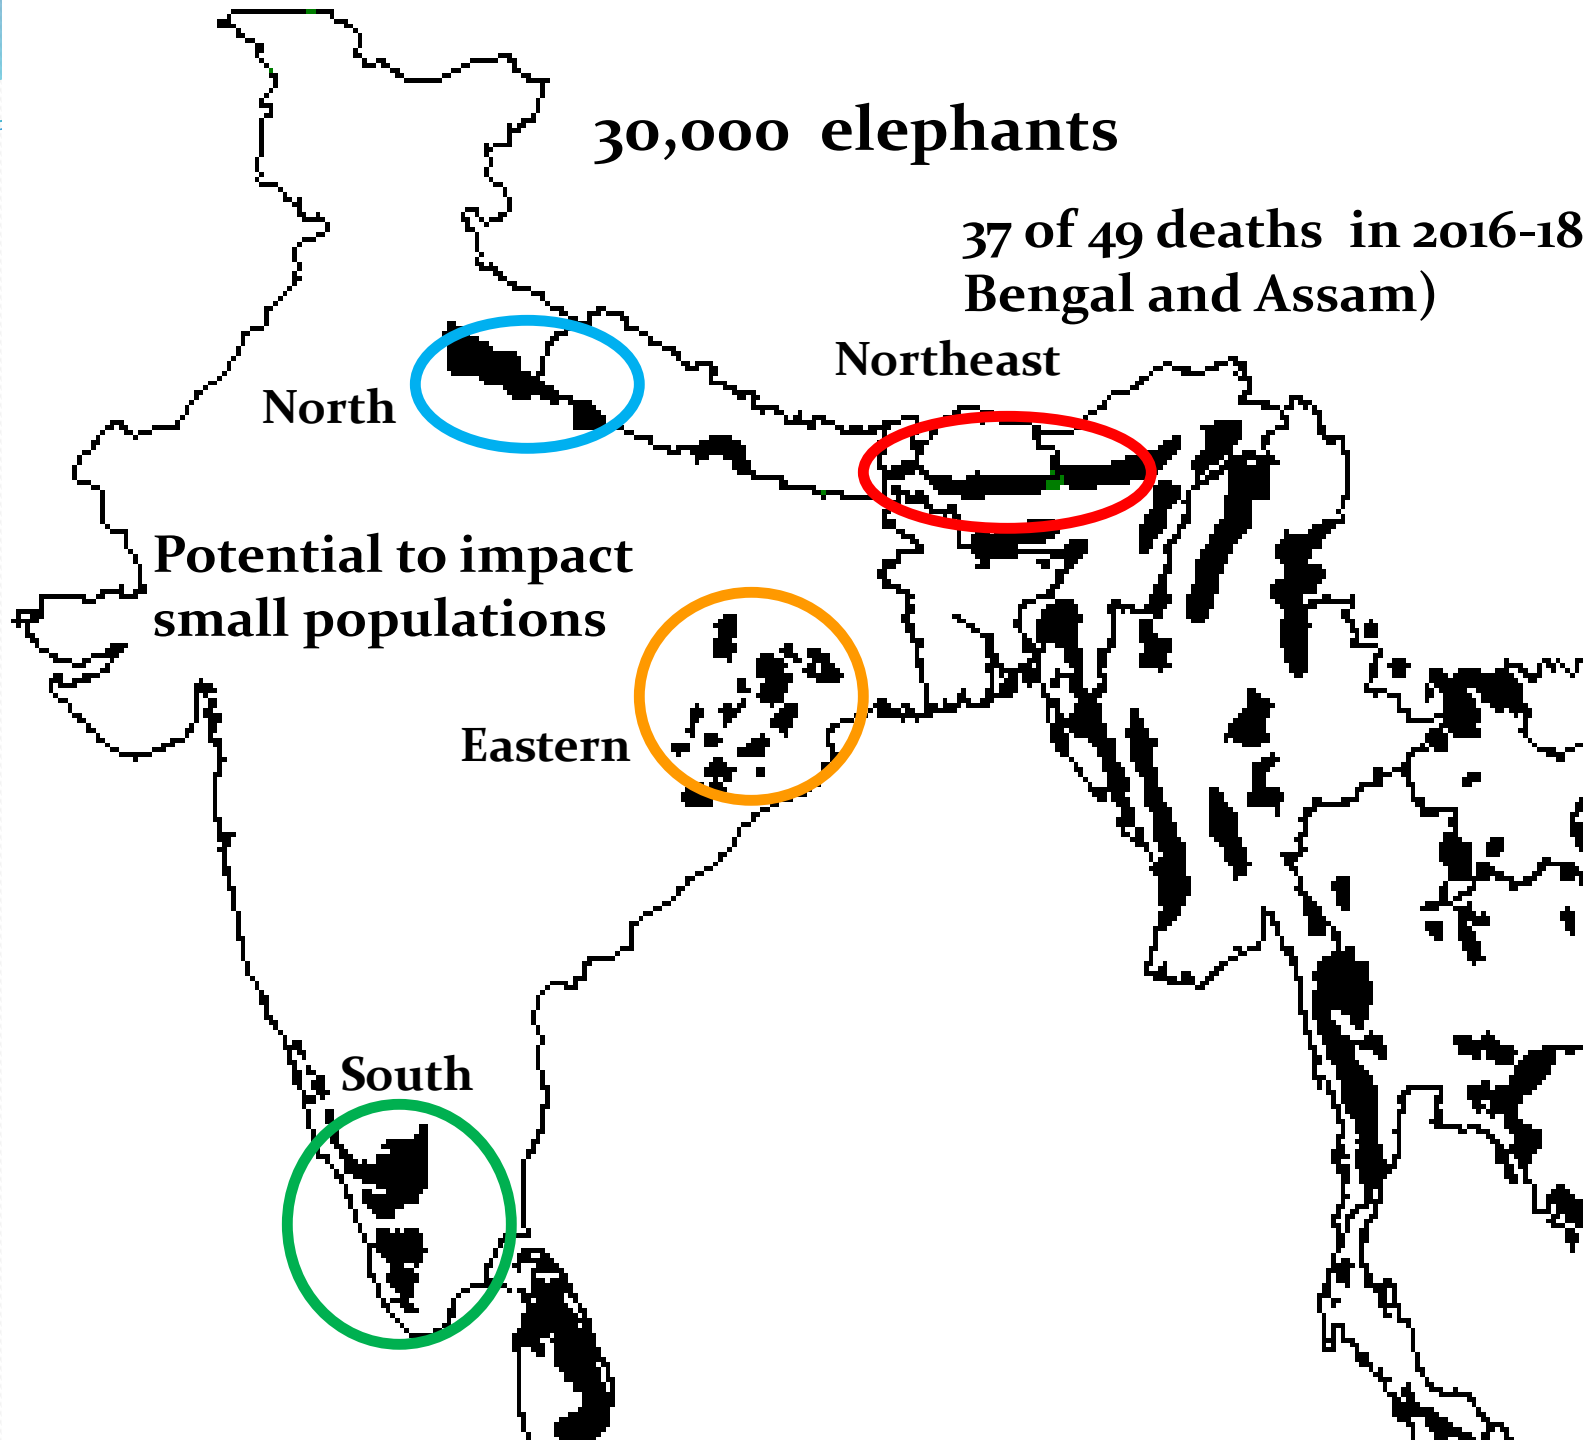

- Fragments habitat
- 1987 – 2018: 249 (8 annually)
- 2009 – 17: 461 electrocuted (58 annually)
- Why it is important?
 - Increasing: 2016-18 – 49 deaths (16 annually)
 - Adversely impacting small populations
 - Sending a very negative conservation message (public outrage)
 - Derailing of trains (threat to human life)
 - Disrupting of rail traffic (Economic loss)

Derailing of train after accident

30,000 elephants

37 of 49 deaths in 2016-18
(Bengal and Assam)

Why is there an increase in such accidents

- Increasing speed of trains due to gauge conversion, doubling of tracks and better engines
- Increase in number of trains
- Increasing number of lines in wildlife habitat
- Other factors: Habitat loss, fragmentation and degradation
 - Dispersing elephants and increased wandering
 - Increased crossing for resources and crop raiding
 - Population increase

Impacts are cumulative

- Anthropogenic pressure
- Linear infrastructure
- Land use changes
- Poaching
- Weeds
- Diversion of river waters
- Disease
- Pollution
- Human wildlife conflict
- Climate change

Did the lion read the book!

Knowledge and goal

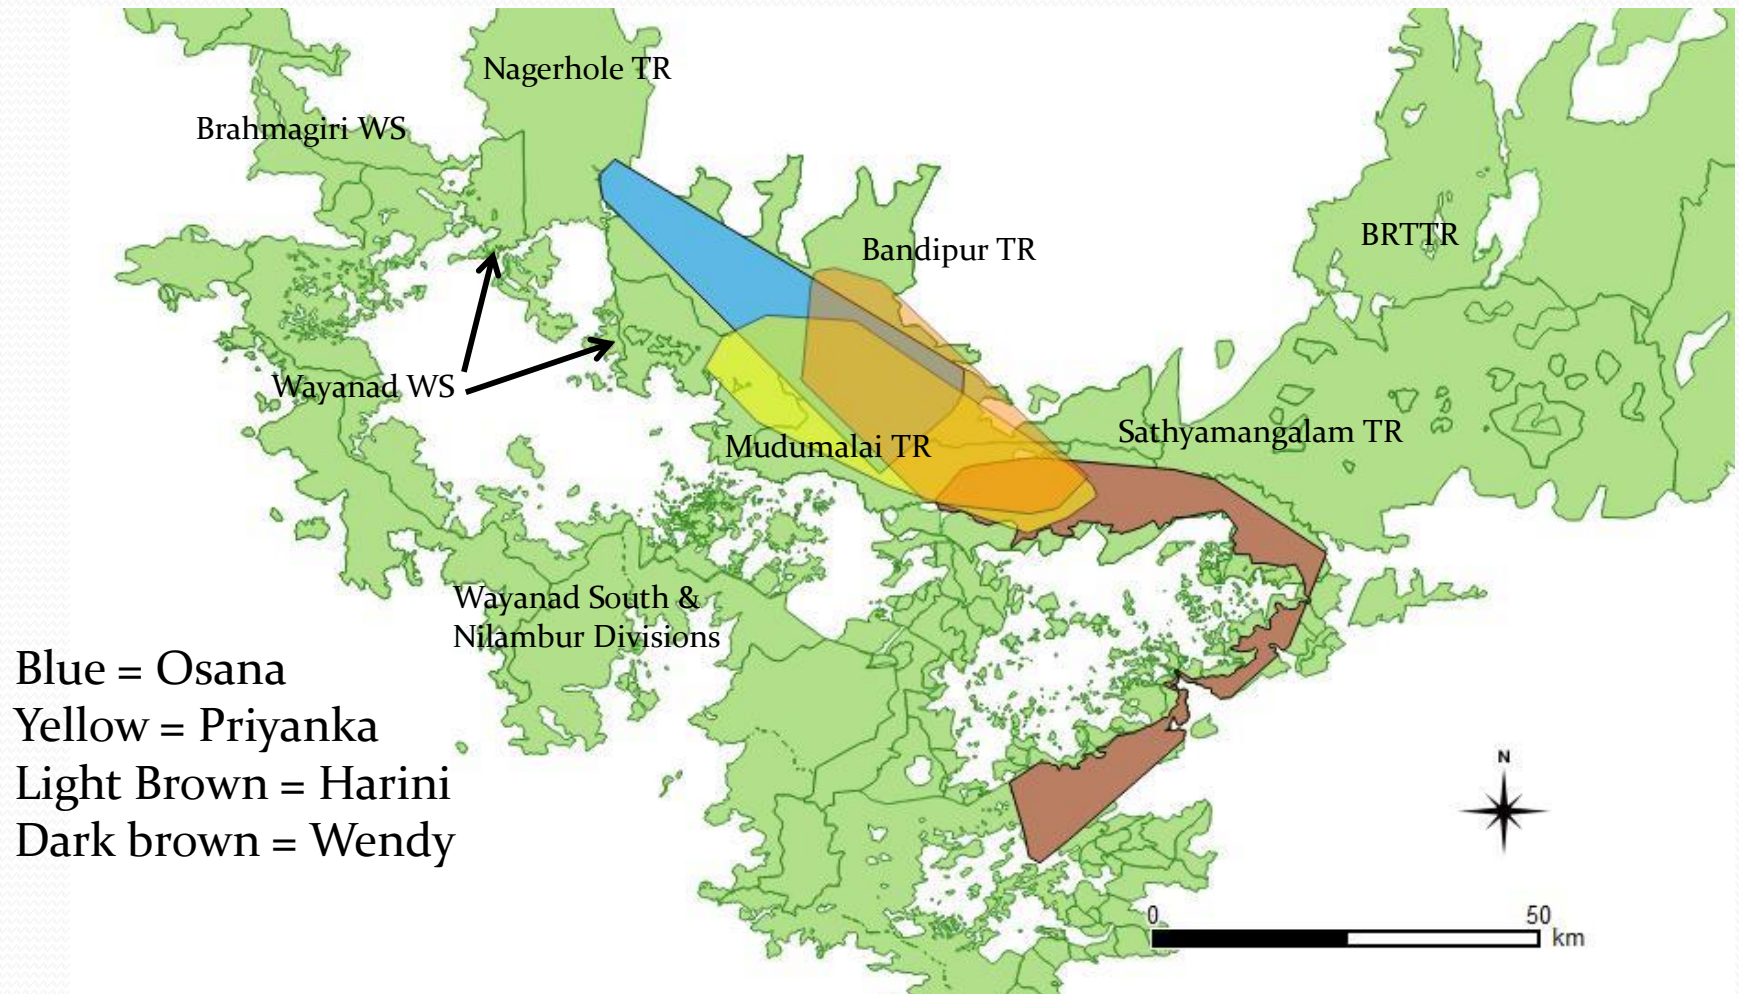

Issues and challenges

- Elephants need to cross the tracks to secure resources
 - Heavy animal - Negotiates ballast and difficult terrain slowly (especially calves)
 - Embankments are death traps
 - Behavioral response (attack as a more of defense)
- Railways has to keep moving
 - Long braking distance (visual responses limited)
 - Need to maintain speed in hill areas
 - Rail network and schedules (delays upset the system)

Behavioral aspects

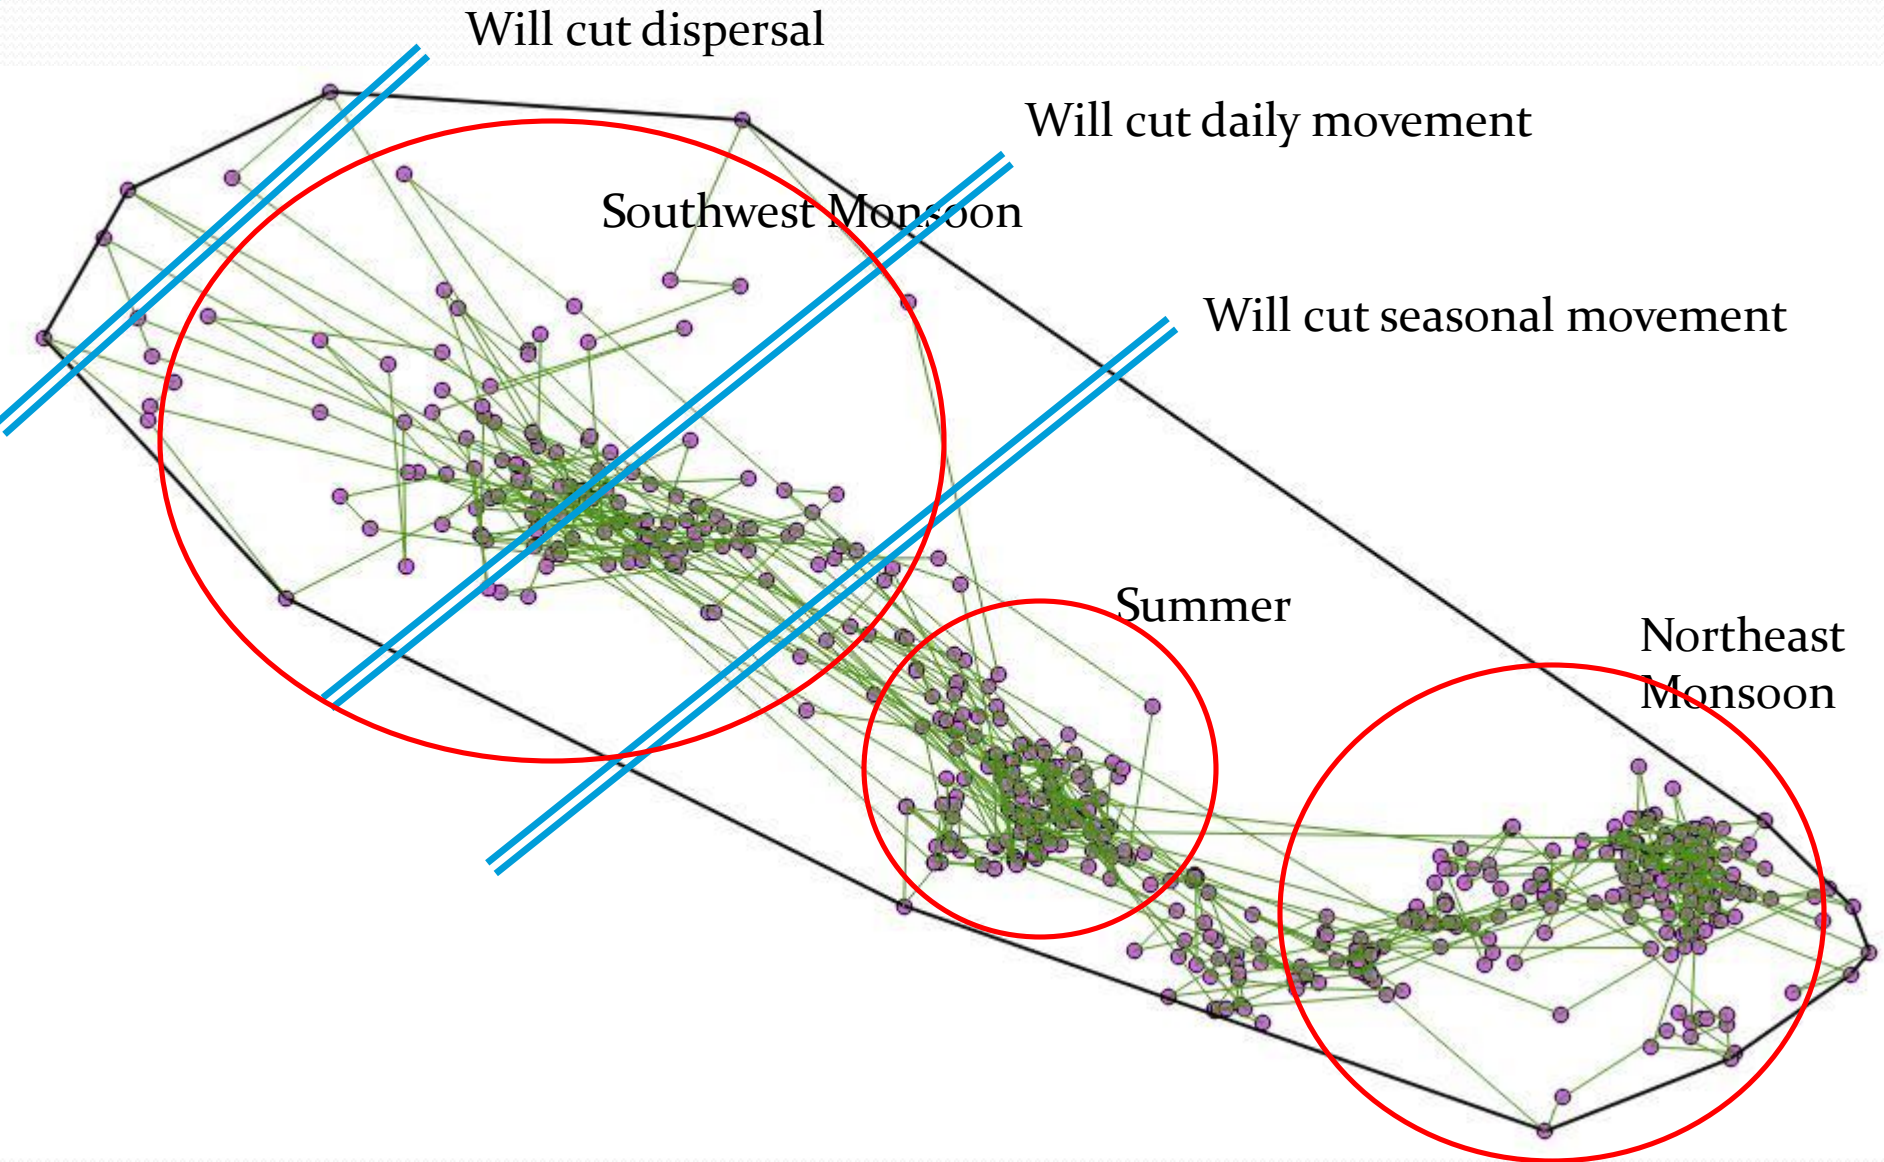

Understanding how elephants move and why

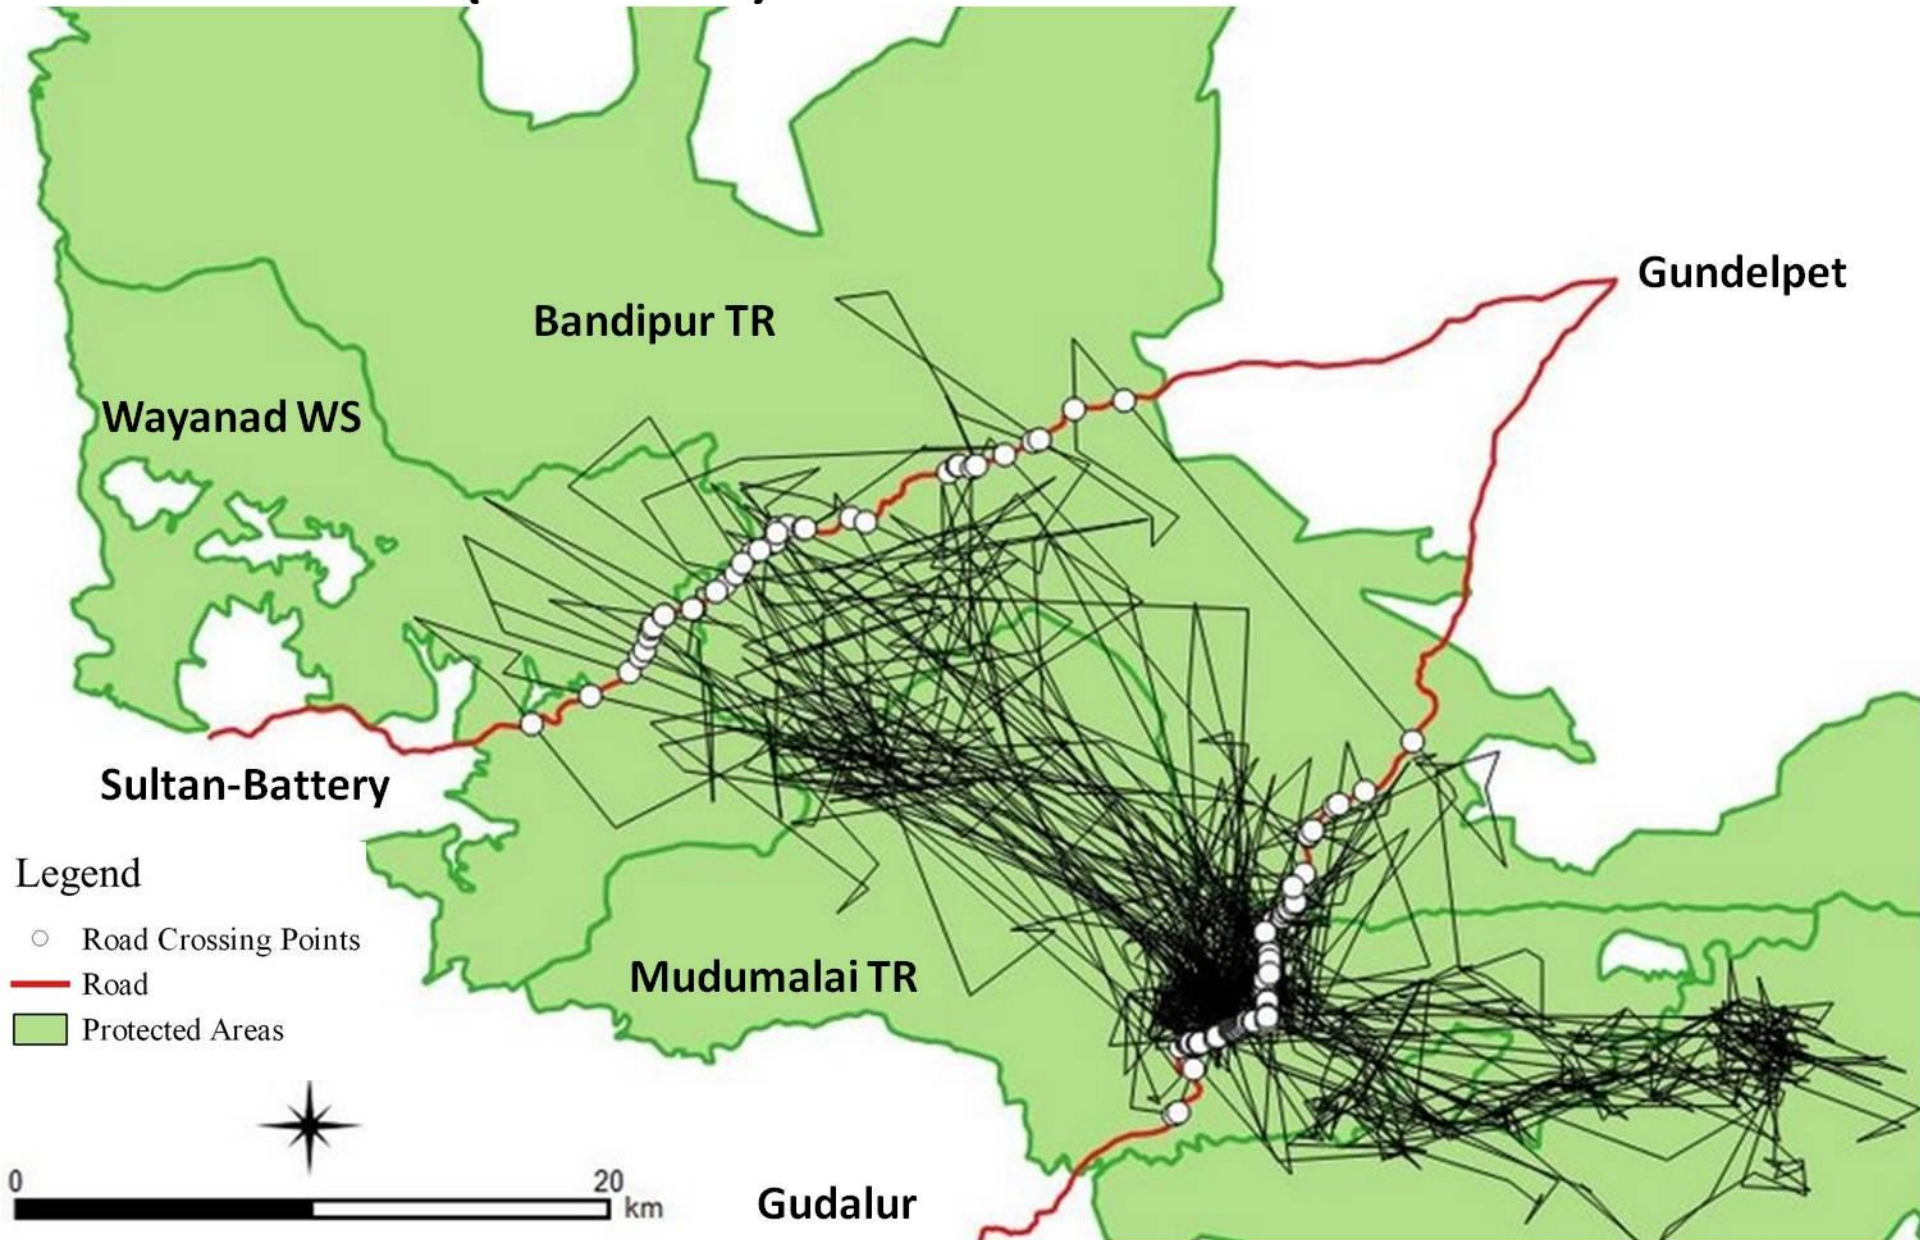

- Ranging is governed by dominance hierarchies

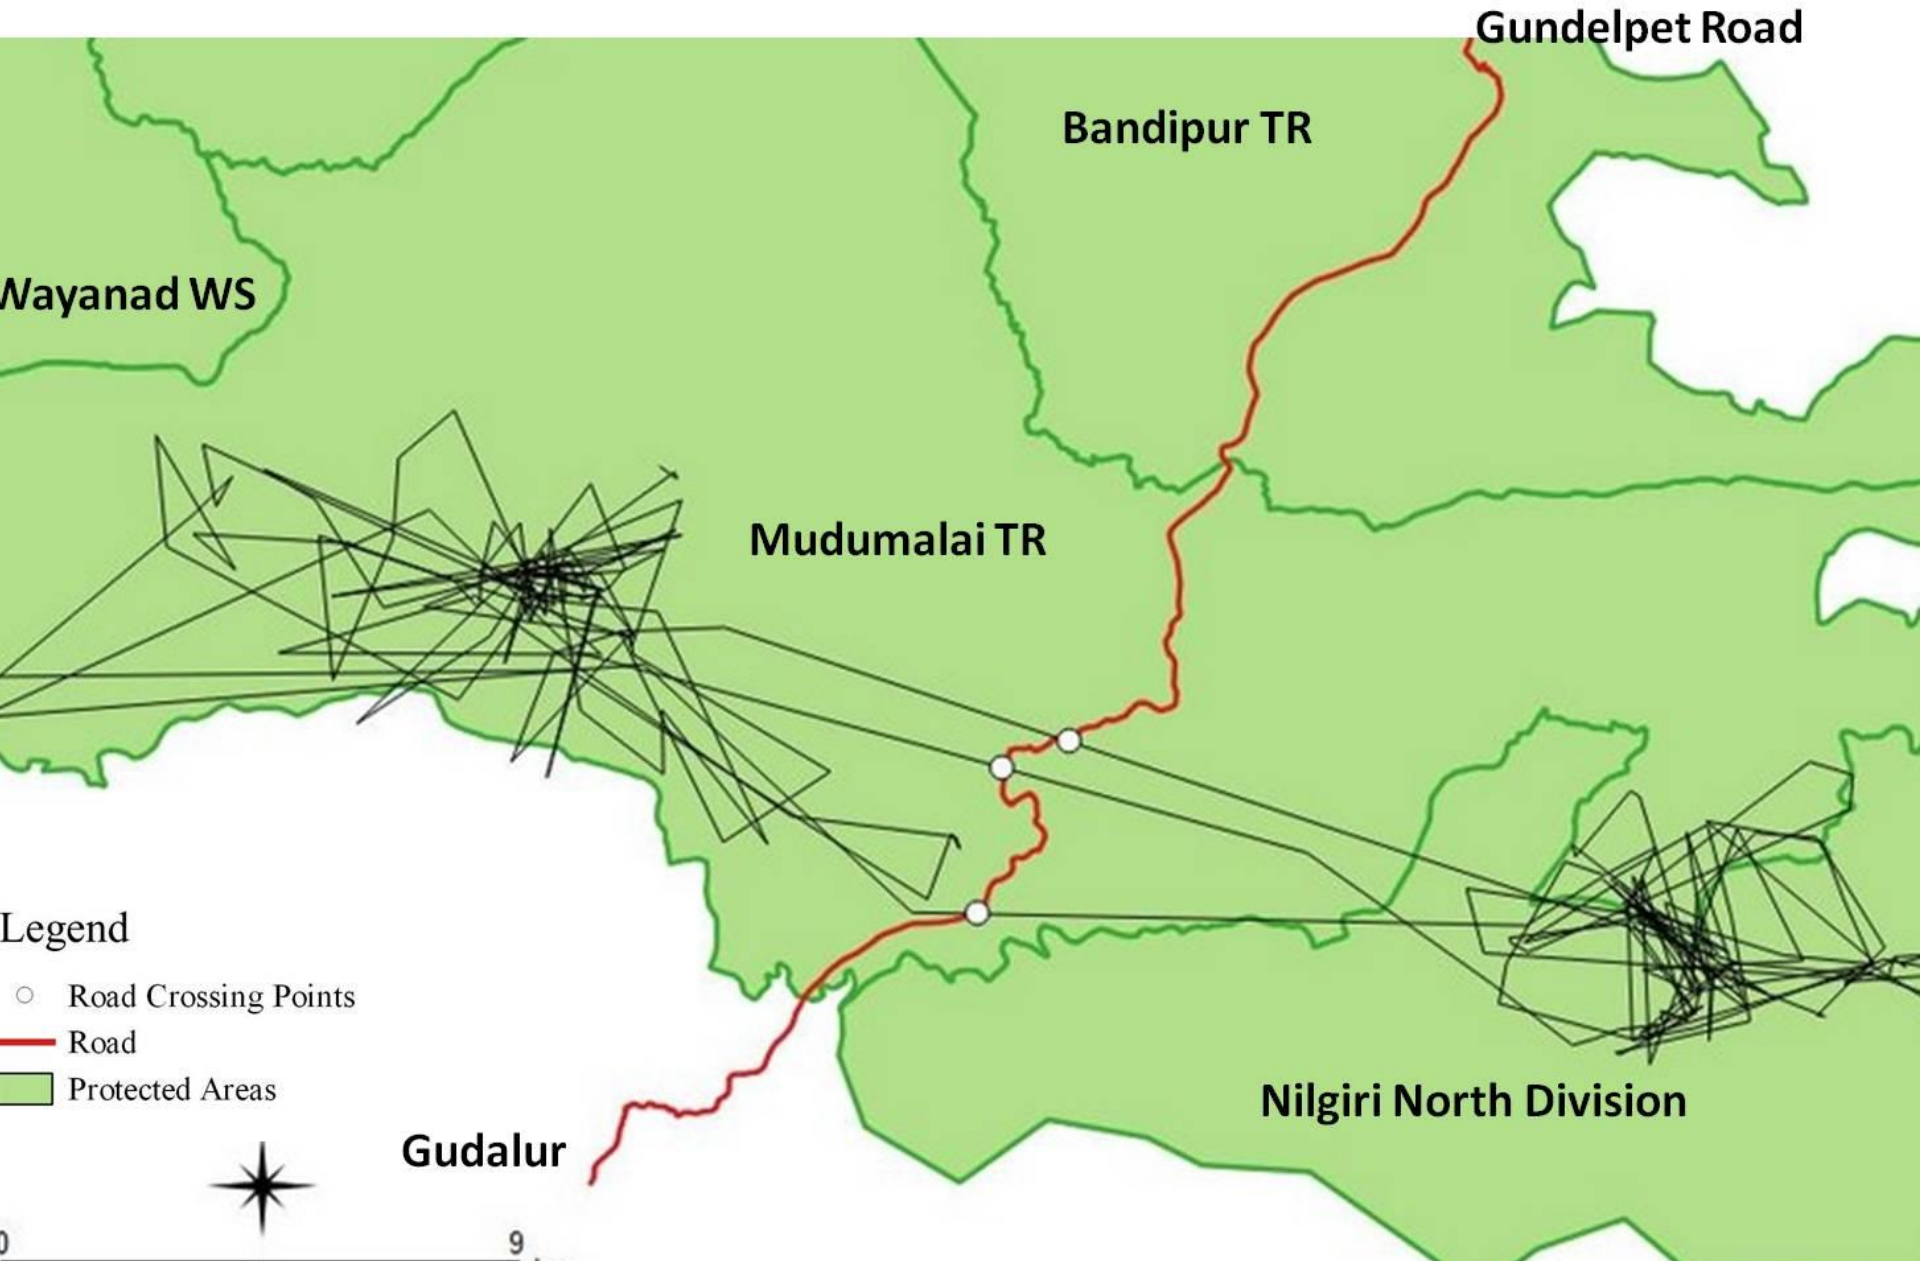

Seasonal ranges within the home range of clan 'Priyanka'

Ranging tracks of two female clans (Priyanka & Hariyai) and one male (Salim Ali) radio-collared in Mudumalai TR

Seasonal movement of Adult male

Daily movement of 2 Clans

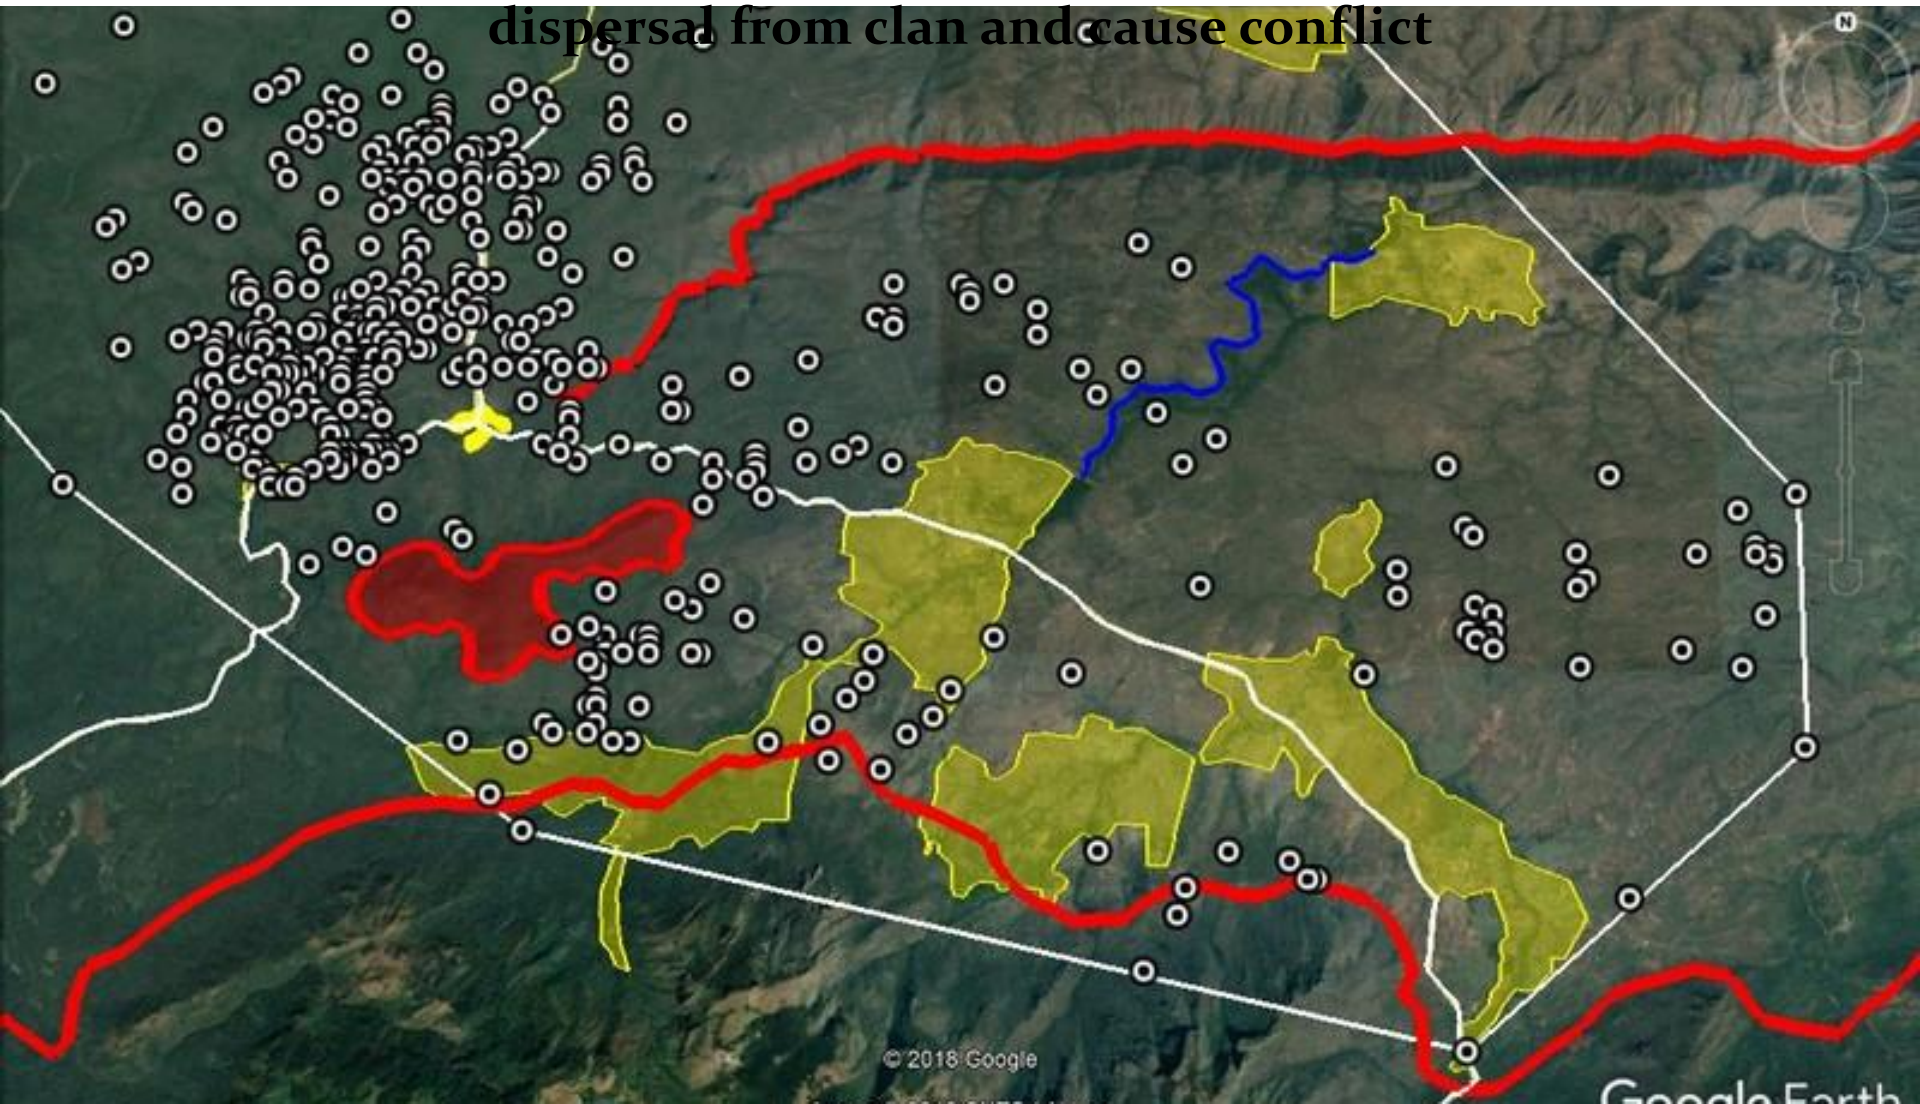

Human settlements

Different clans and males use different routes

Clan Harini uses both the northern and southern routes of the corridor; uses corridor for movement between seasonal ranges and as foraging area; loss would result in breaking of home range, access to males, male dispersal from clan and cause conflict

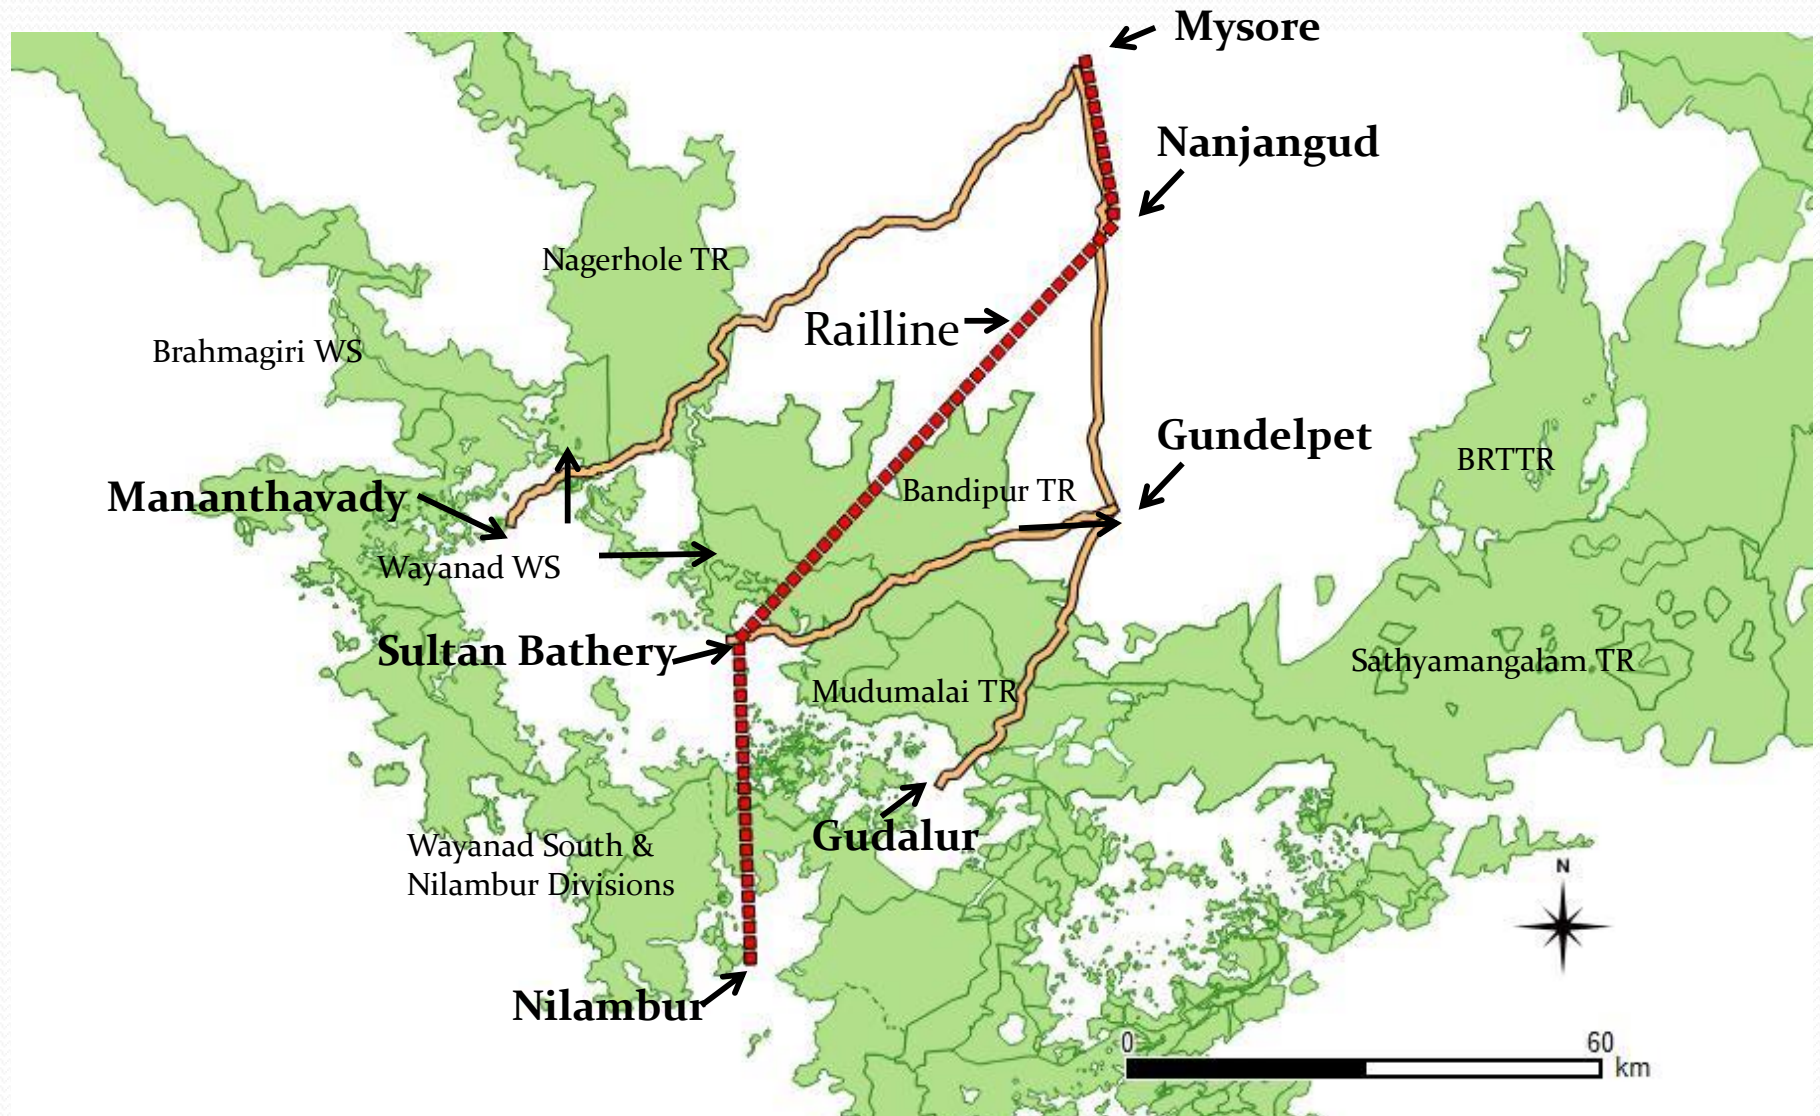

Avoiding accidents

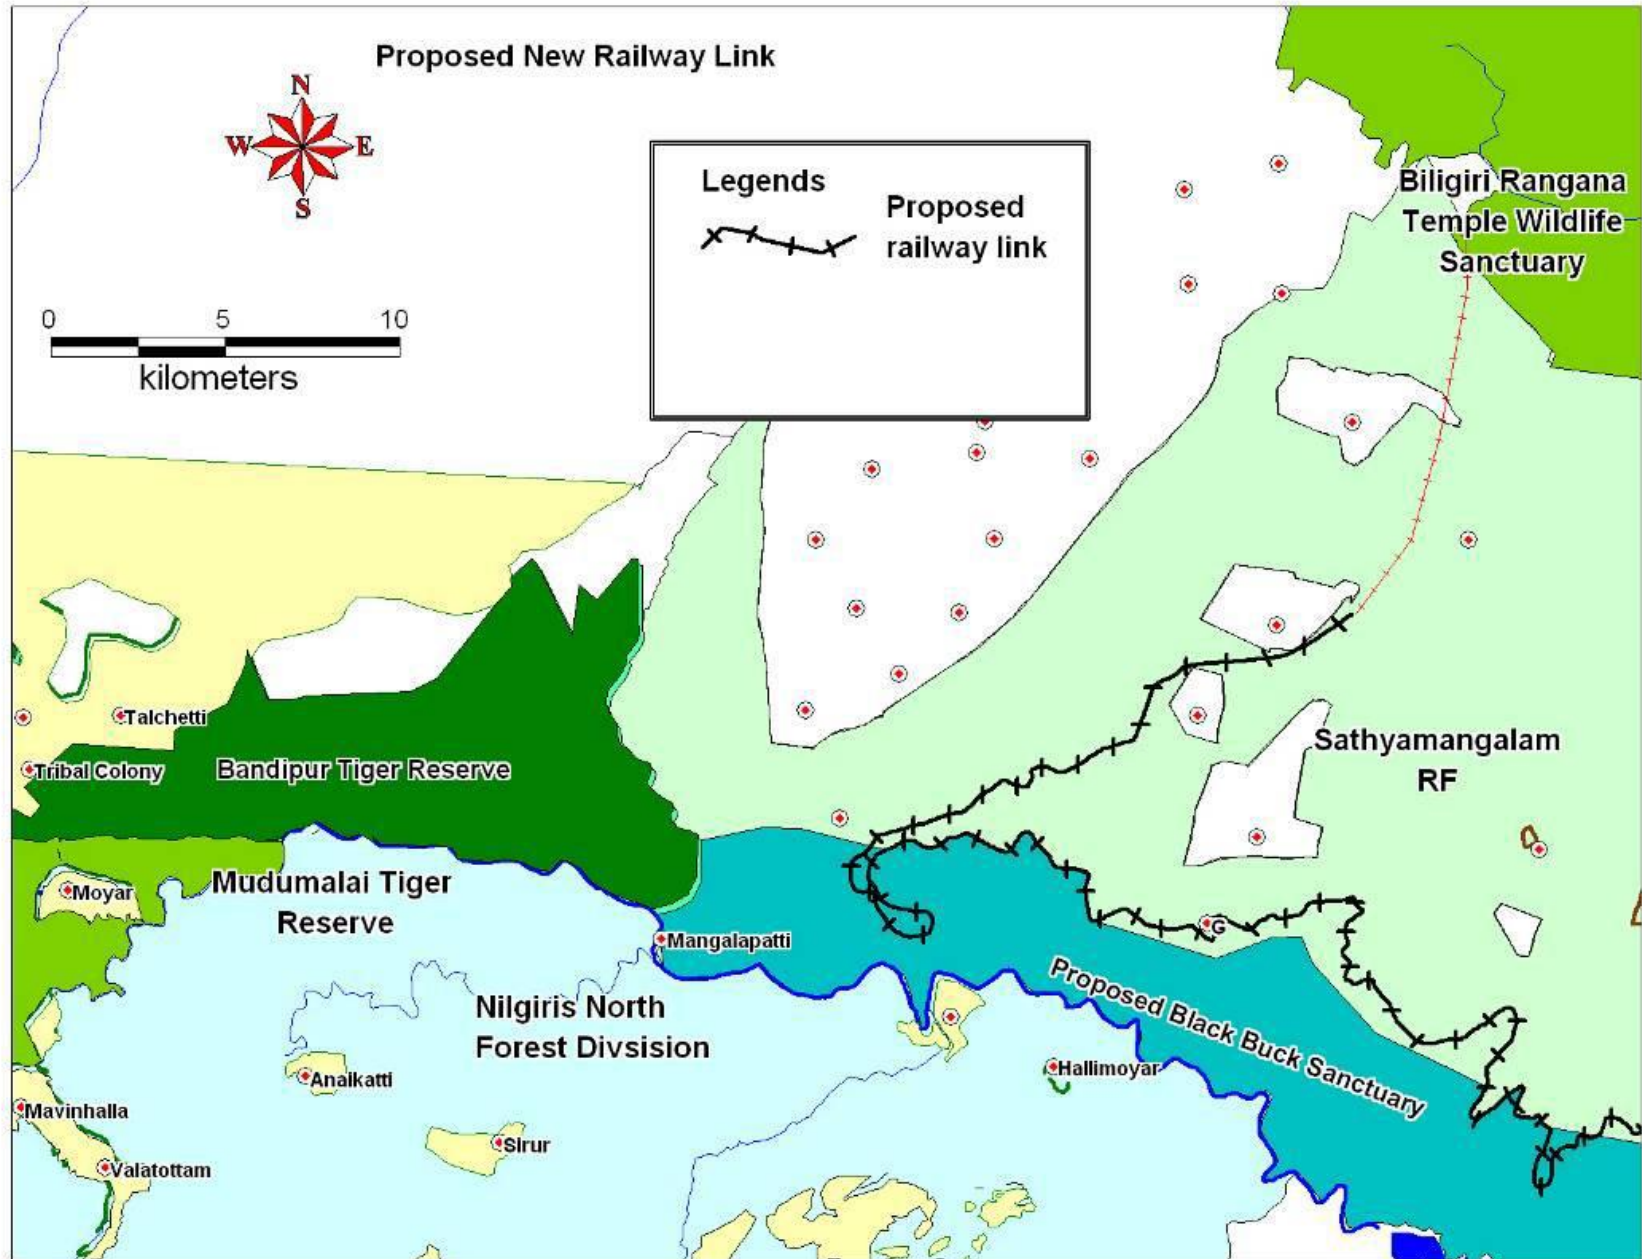

- Minimizing the need for elephants to cross tracks
 - Routing rail line outside the forest
 - Providing resource on one side of track
 - Containing anthropogenic drivers of dispersal
- Facilitating crossing
 - Overpasses and underpasses (expensive)
 - Providing level crossing (low cost)
- Funneling crossing to select sites
- Stopping of crossing at dangerous sites

- 
- Preventive action by moving trains
 - Early warning and alerting systems
 - Identified locations where trains slow down
 - Deterrents (keep elephants away from tracks)
 - Location based
 - Train based

Proposed railway route – Bandipur TR and Wayanad WS

Proposed Sathyamangalam rail link

Facilitating easy crossings on regular paths

Flat route requires creation of embankments which become death traps

Areas with embankments need to be blocked or sides levelled to facilitate easy escape

Embankments may also provide opportunity for creating crossings

Blind curves

1. Stopping elephants crossing at such locations
2. Clearing vegetation to improve visibility
3. Going slow on such sections

Daily movement of 2 Clans

Funneling or restricting access using barriers

Funneling using barriers

Types of barriers

Poor construction

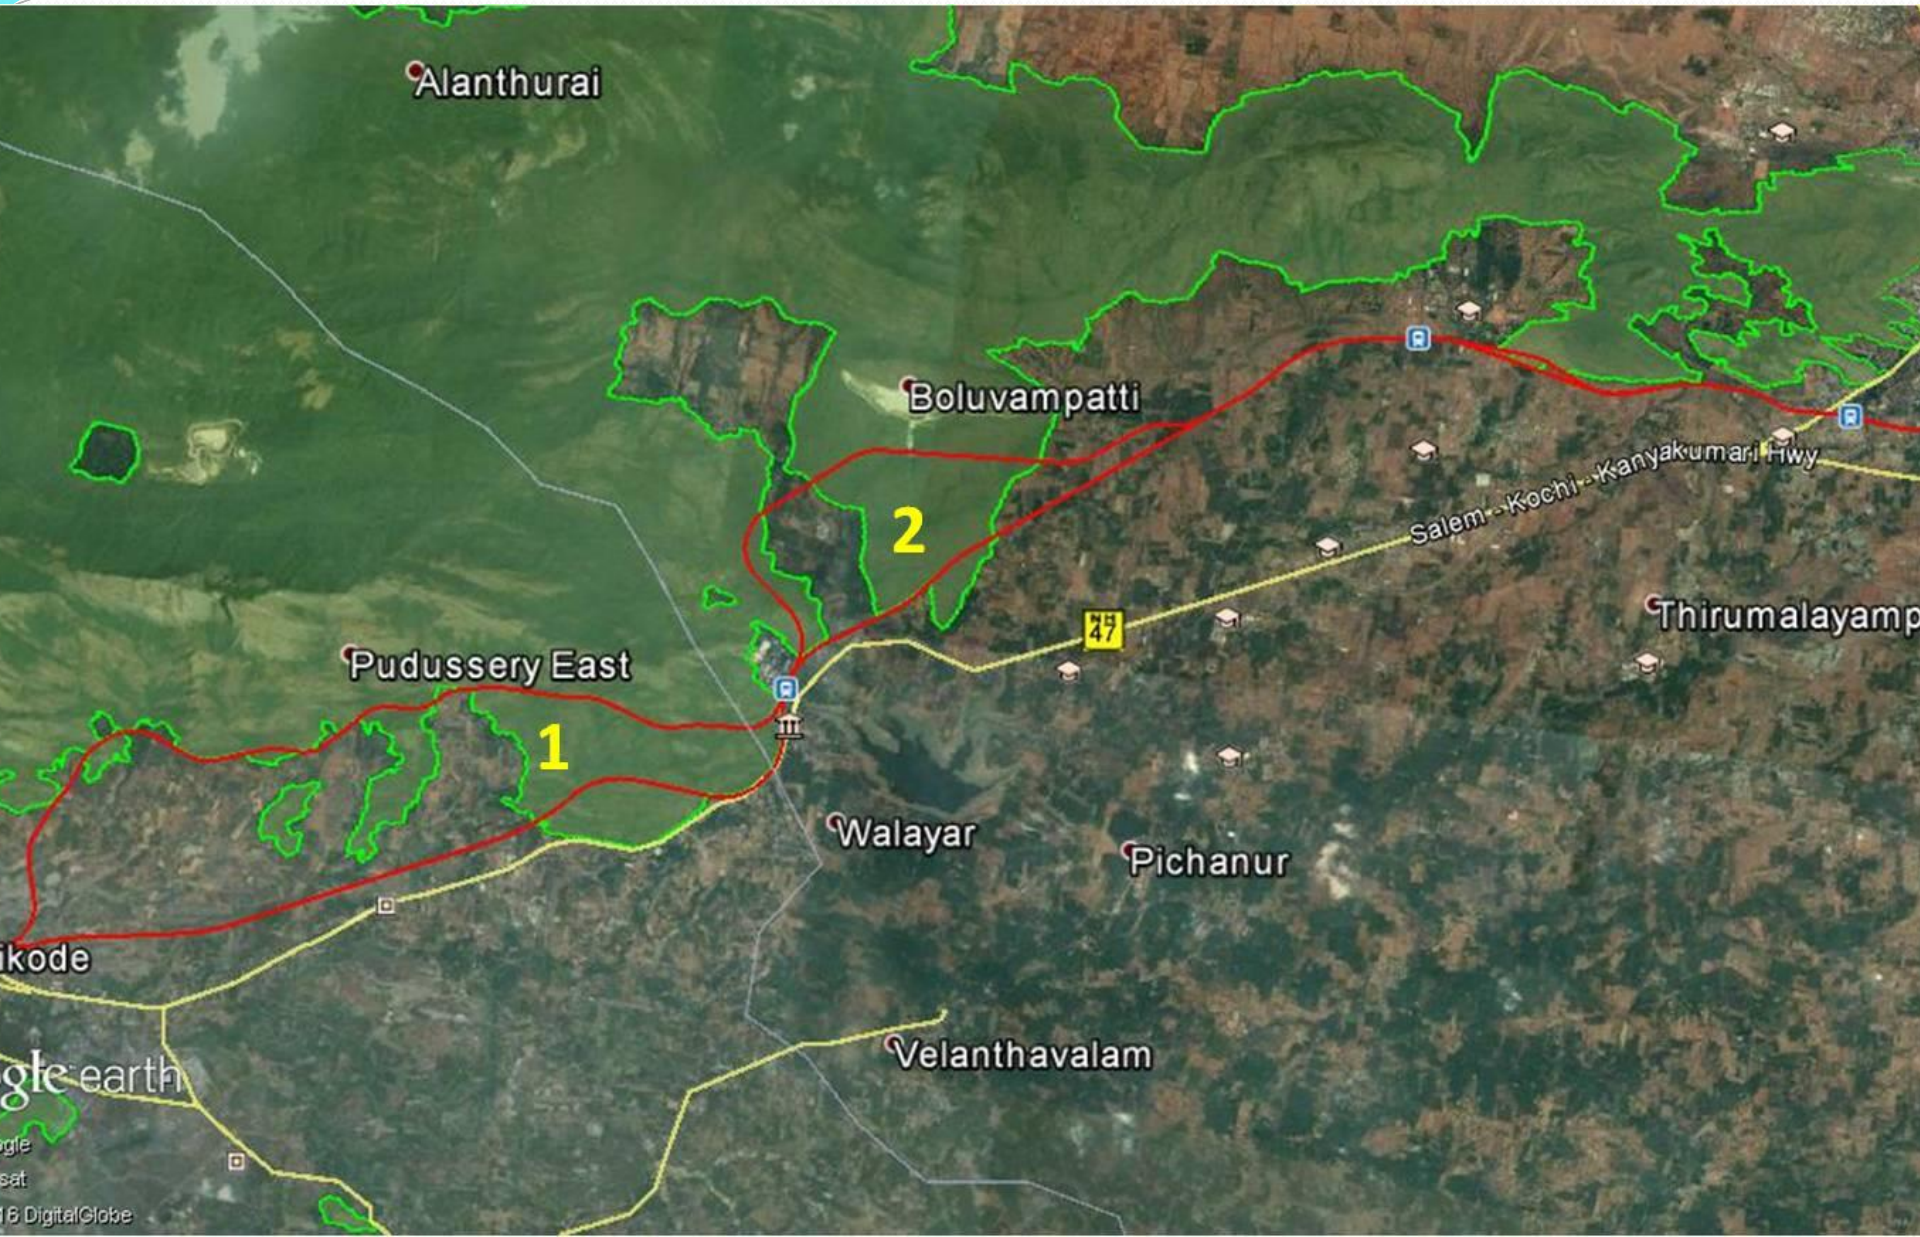

Elephants are intelligent

Pallakad-Coimbatore Railway line – HEC mitigation

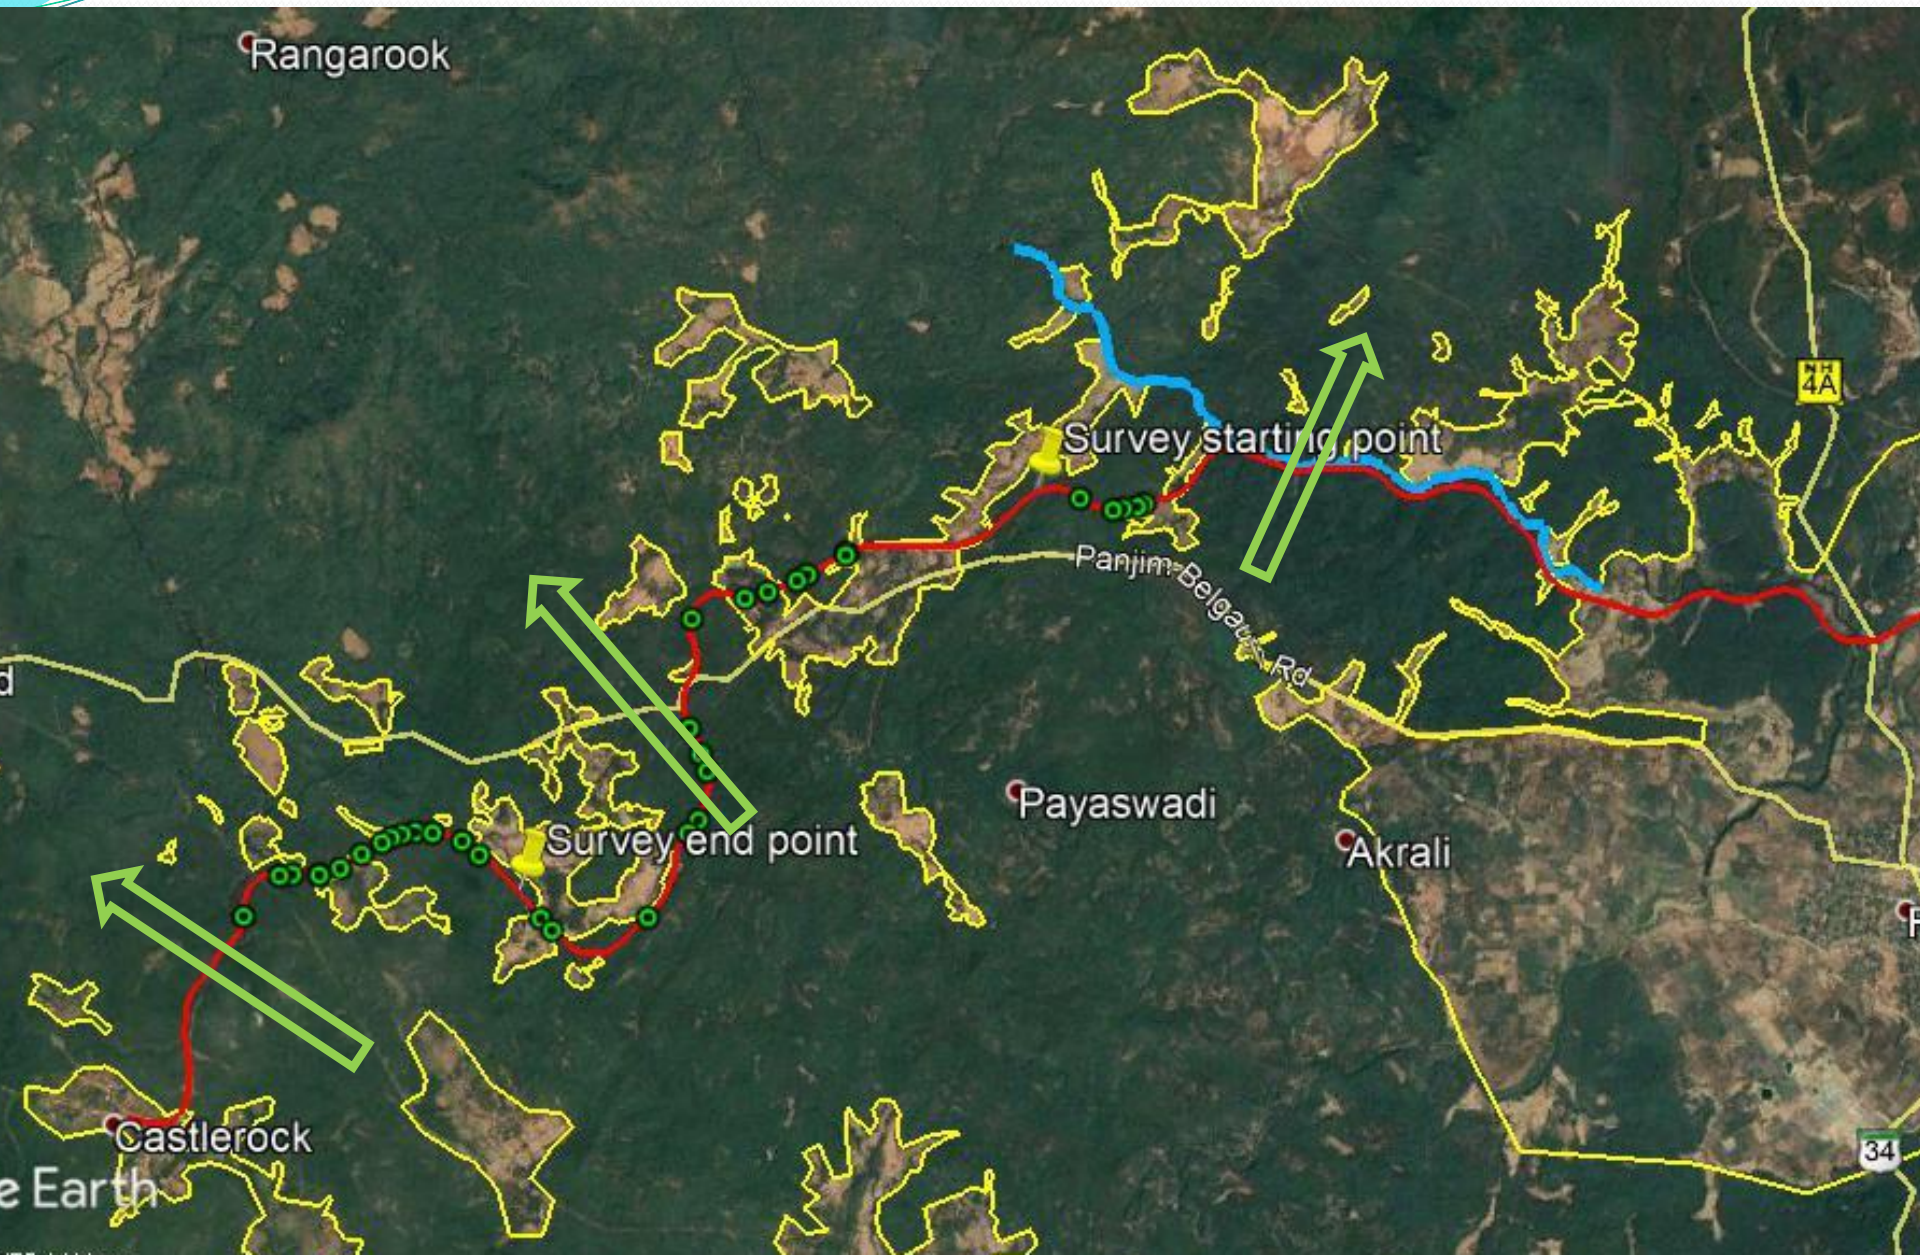

Slowing down of trains

Early warning systems

- Detection and avoidance
 - Geo-sensor, PIR, Camera, People
 - Information delivery to train driver
 - Railway braking distance critical to determine detection distance to be useful
- Deterrents
 - To drive away elephants from track at time of train's arrival (can get habituated)
 - To keep elephants away from track (causes fragmentation of habitat)
- Need to keep certain sections free of elephants by allowing passage at specific locations (habituation to slow speed and reduced disturbance)
- Need to keep buffer time (in case of slowing down)

Selecting locations for mitigation: Landscape level

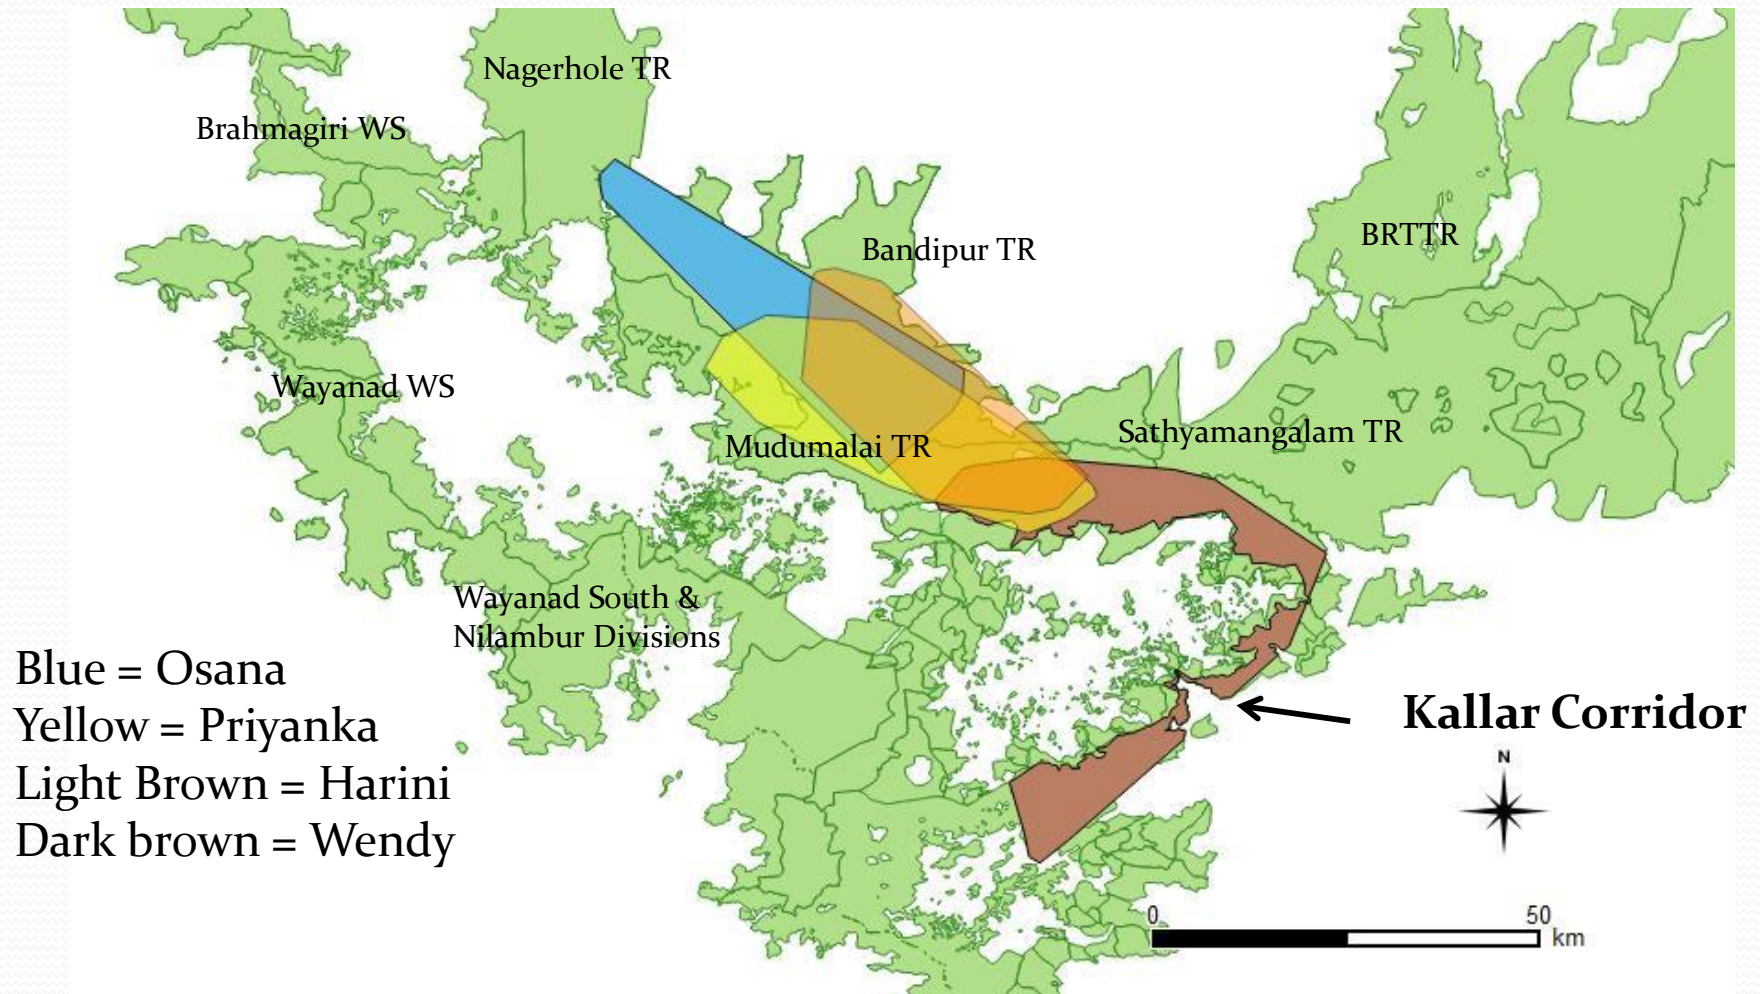

Functionality

Attention to detail: Animal's needs

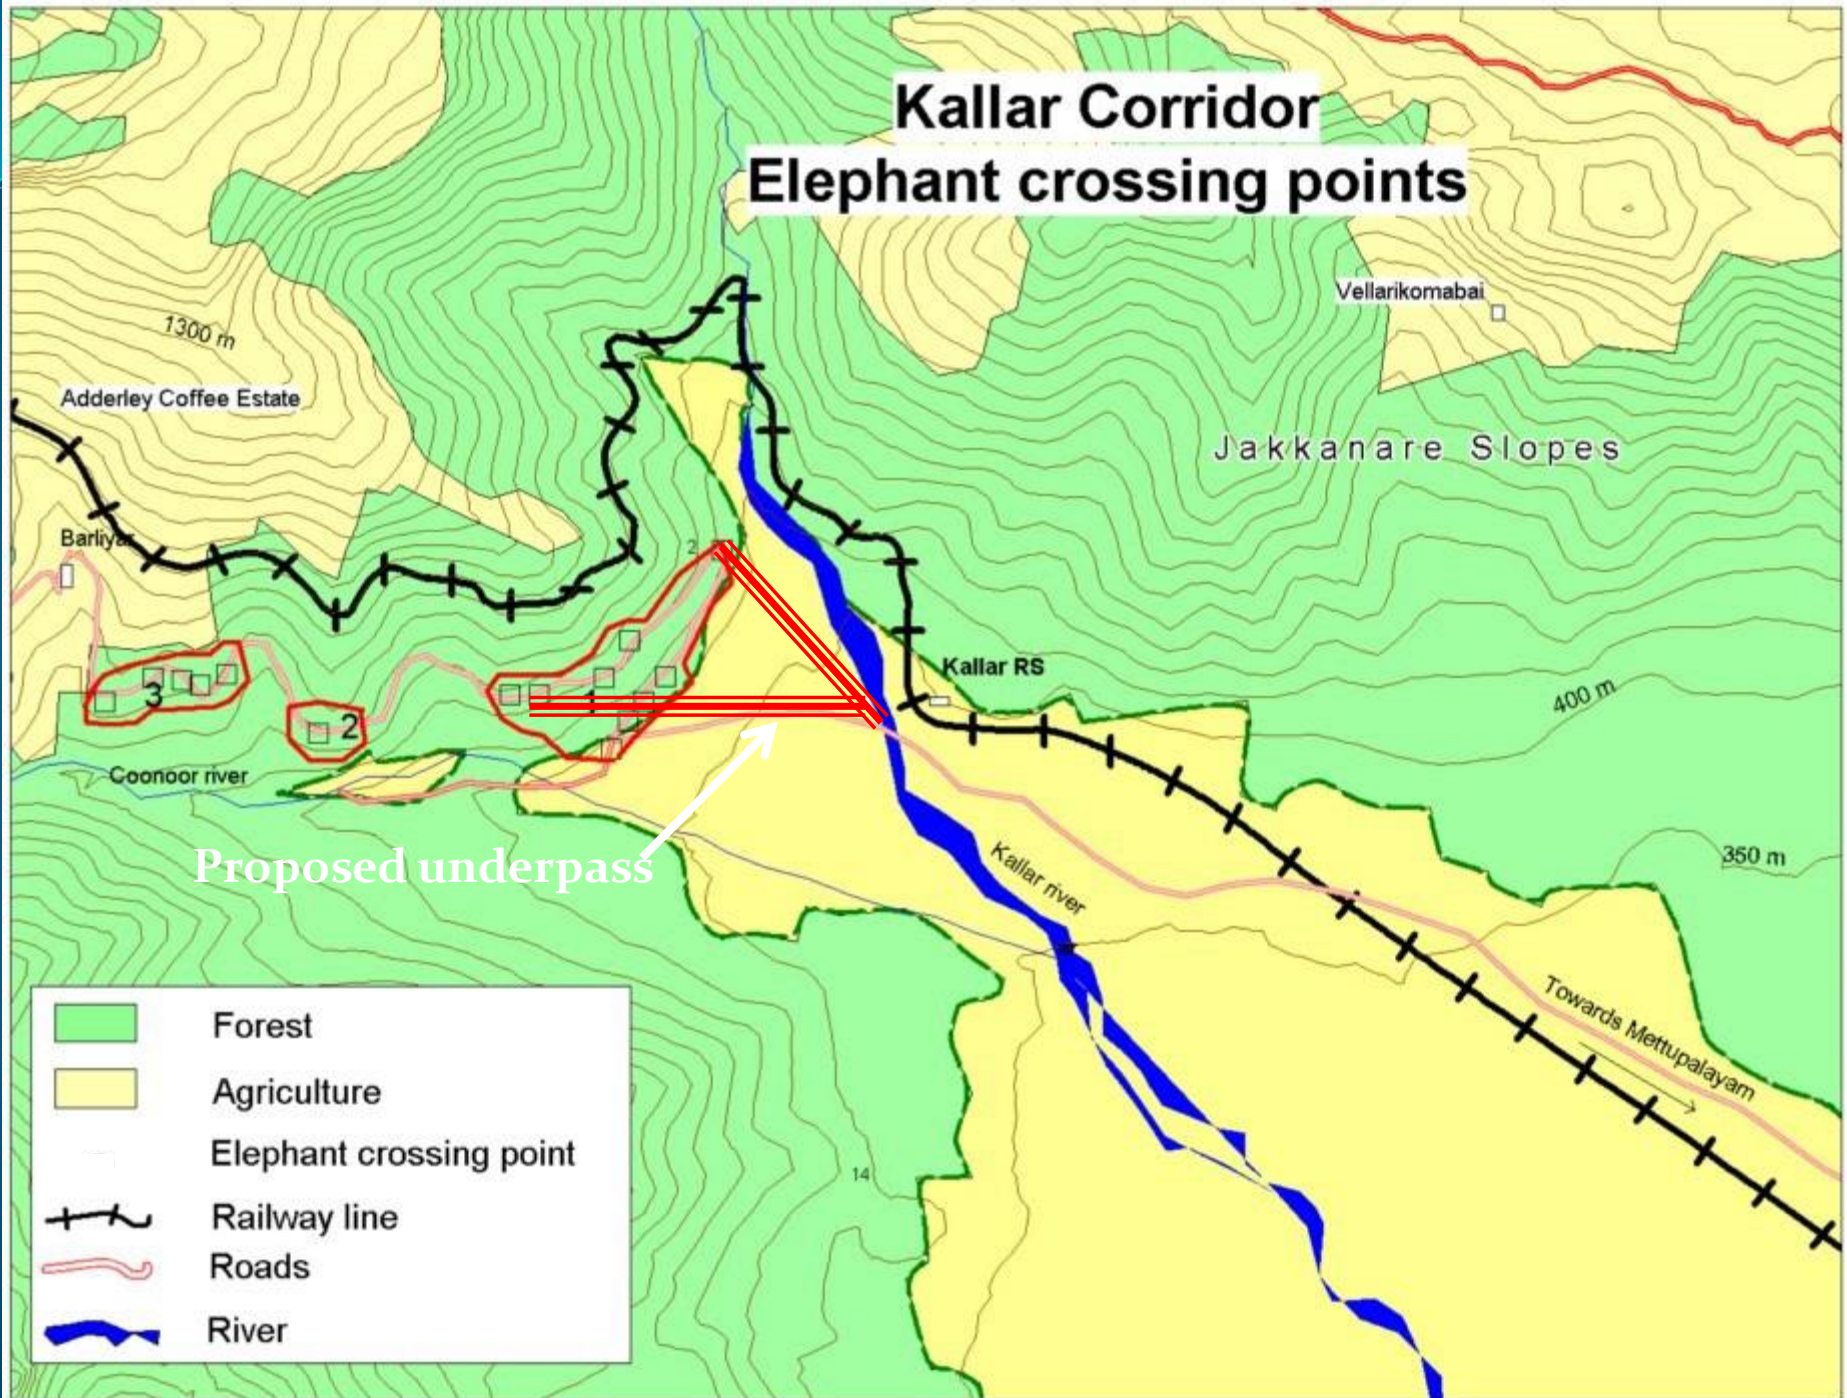

Kallar Corridor

- Ranging is governed by dominance hierarchies

Kallar Corridor

Elephant crossing points

**phants have stood by us and worked for us for 5000 years - it is
e made a token repayment, by conserving what little remains of
abitat. And in doing so we are only saving what little remains of
forests and our children's future**
