

# Indoor air quality in the new normal: The importance of good indoor air quality

Victorio B. Molina, PhD  
Professor of Environmental and Occupational Health

**COLLEGE OF PUBLIC HEALTH**  
**University of the Philippines Manila**

**SEAMEO TROPMED Philippines**  
*Regional Centre for Public Health, Hospital Administration,  
Environmental and Occupational Health*

## Session objectives

At the end of the session participants should have a practical understanding of:

- Drivers of indoor air quality
- Sick building syndrome and its impact to workers health
- Guidelines in the workplace to ensure public health safety in the new normal
- Monitoring indoor air quality

**Abstract:** Indoor air pollution (IAP) is a serious threat to human health, causing millions of deaths each year. A plethora of pollutants can result in IAP; therefore, it is very important to identify their main sources and concentrations and to devise strategies for the control and enhancement of indoor air quality (IAQ). Herein, we provide a critical review and evaluation of the major sources of major pollutant emissions, their health effects, and issues related to IAP-based illnesses, including sick building syndrome (SBS) and building-related illness (BRI). In addition, the strategies and approaches for control and reduction of pollutant concentrations are pointed out, and the recent trends in efforts to resolve and improve IAQ, with their respective advantages and potentials, are summarized. It is predicted that the development of novel materials for sensors, IAQ-monitoring systems, and smart homes is a promising strategy for control and enhancement of IAQ in the future.

**Keywords:** indoor air quality; indoor pollution; smart home; human diseases

# Acceptable Indoor Air

“Air in which **there are no known contaminants at harmful concentrations** and which a substantial majority (usually 80%) of the people exposed do not express dissatisfaction”

ASHRAE 62-1999

(The American Society of Heating, Refrigerating and Air-Conditioning Engineers)

Environmental and Occupational Health

# Reasons for Special Concern

~75–90% of time spent indoors

Many air pollutants known to be hazardous to health are emitted indoors

**Indoor environments trap pollutants**  
Levels may be 2 to 5 times higher than outside

# Potential Sources of IAP

| Source  | Pollutant                                |
|---|--|
| Ventilation and air-conditioning systems (HVAC) | Molds, bacteria, CO                      |
| Restrooms                                       | Molds and fungi                          |
| Furniture and carpets                           | Formaldehyde, organic solvents, asbestos |
| Office machines                                 | Chemicals                                |

# Indoor Contaminants

- Chemical contaminants
- Biological contaminants

BACTERIA

VIRUSES

MOLD

ALLERGIES

CHEMICALS

PET ODORS & DANDER

COOKING ODORS

DUST MITE FECAL MATTER

# Chemical Contaminants

- VOCs
- Respirable particles (PM 10 and 2.5)
- Carbon dioxide

**Abstract:** Sars-Cov-2 virus (COVID-19) is a member of the coronavirus family and is responsible for the pandemic recently declared by the World Health Organization. A positive correlation has been observed between the spread of the virus and air pollution, one of the greatest challenges of our millennium. COVID-19 could have an air transmission and atmospheric particulate matter (PM) could create a suitable environment for transporting the virus at greater distances than those considered for close contact. Moreover, PM induces inflammation in lung cells and exposure to PM could increase the susceptibility and severity of the COVID-19 patient symptoms. The new coronavirus has been shown to trigger an inflammatory storm that would be sustained in the case of pre-exposure to polluting agents. In this review, we highlight the potential role of PM in the spread of COVID-19, focusing on Italian cities whose PM daily concentrations were found to be higher than the annual average allowed during the months preceding the epidemic. Furthermore, we analyze the positive correlation between the virus spread, PM, and angiotensin-converting enzyme 2 (ACE2), a receptor involved in the entry of the virus into pulmonary cells and inflammation.

**Keywords:** COVID-19; particulate matter; ACE2; inflammation; oxidative stress

- **well-maintained** and operated **HVAC** system can **reduce** the spread of **COVID-19** in indoor spaces by increasing the rate of air change
- **recirculation** modes (which recirculate the air) should **not** be used
- HVAC systems should be regularly **inspected**, **maintained** and **cleaned**

# Sick Building Syndrome (SBS)

- SBS was first coined in the 1970s
- Set of symptoms associated with **time spent** in building were observed
- Respiratory tract irritation, skin irritation, headache, dizziness, nausea, fatigue, concentration problems

# Sick Building Syndrome

- Symptoms **diminish** or **cease** when occupants **leave** the building
- Cannot be **traced** to specific **pollutants** or **sources** within the building

COLLEGE OF PUBLIC HEALTH  
University of the Philippines Manila

SEAMEO TROPED Philippines

Environmental and Occupational Health

# Sick Building Syndrome

- Ozone produced by **printers** and **photocopiers**
- **Biological** Pollutants such as viruses, bacteria, pollen
- **Electromagnetic** radiation like televisions, **computers** and microwaves
- Inadequate **ventilation** or **defective** HVAC systems

# Sick Building Syndrome

- **Control Measures** include a general **cleanliness** of the building
- Regular **cleaning** and **maintenance** of HVAC system
- No **smoking** in the workplace
- **IEC** is a key intervention
