Systematic Asset Management Software 4 Irrigators (SAMS4i):

- SAMS4i is a GIS based program for planning, operating and managing asset networks based on spatial and non-spatial data
- The software has the capability to store and analyze multi-layered (assets) information and manipulating individual and aggregated outputs to improve management and maintenance

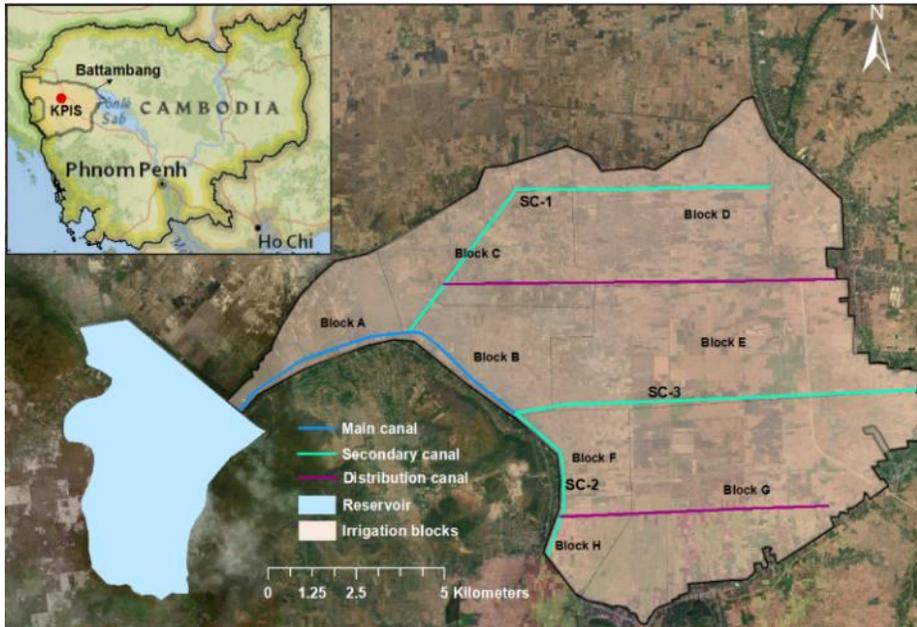

Assessing performance and prioritising investments in Sri Lanka's irrigation sector

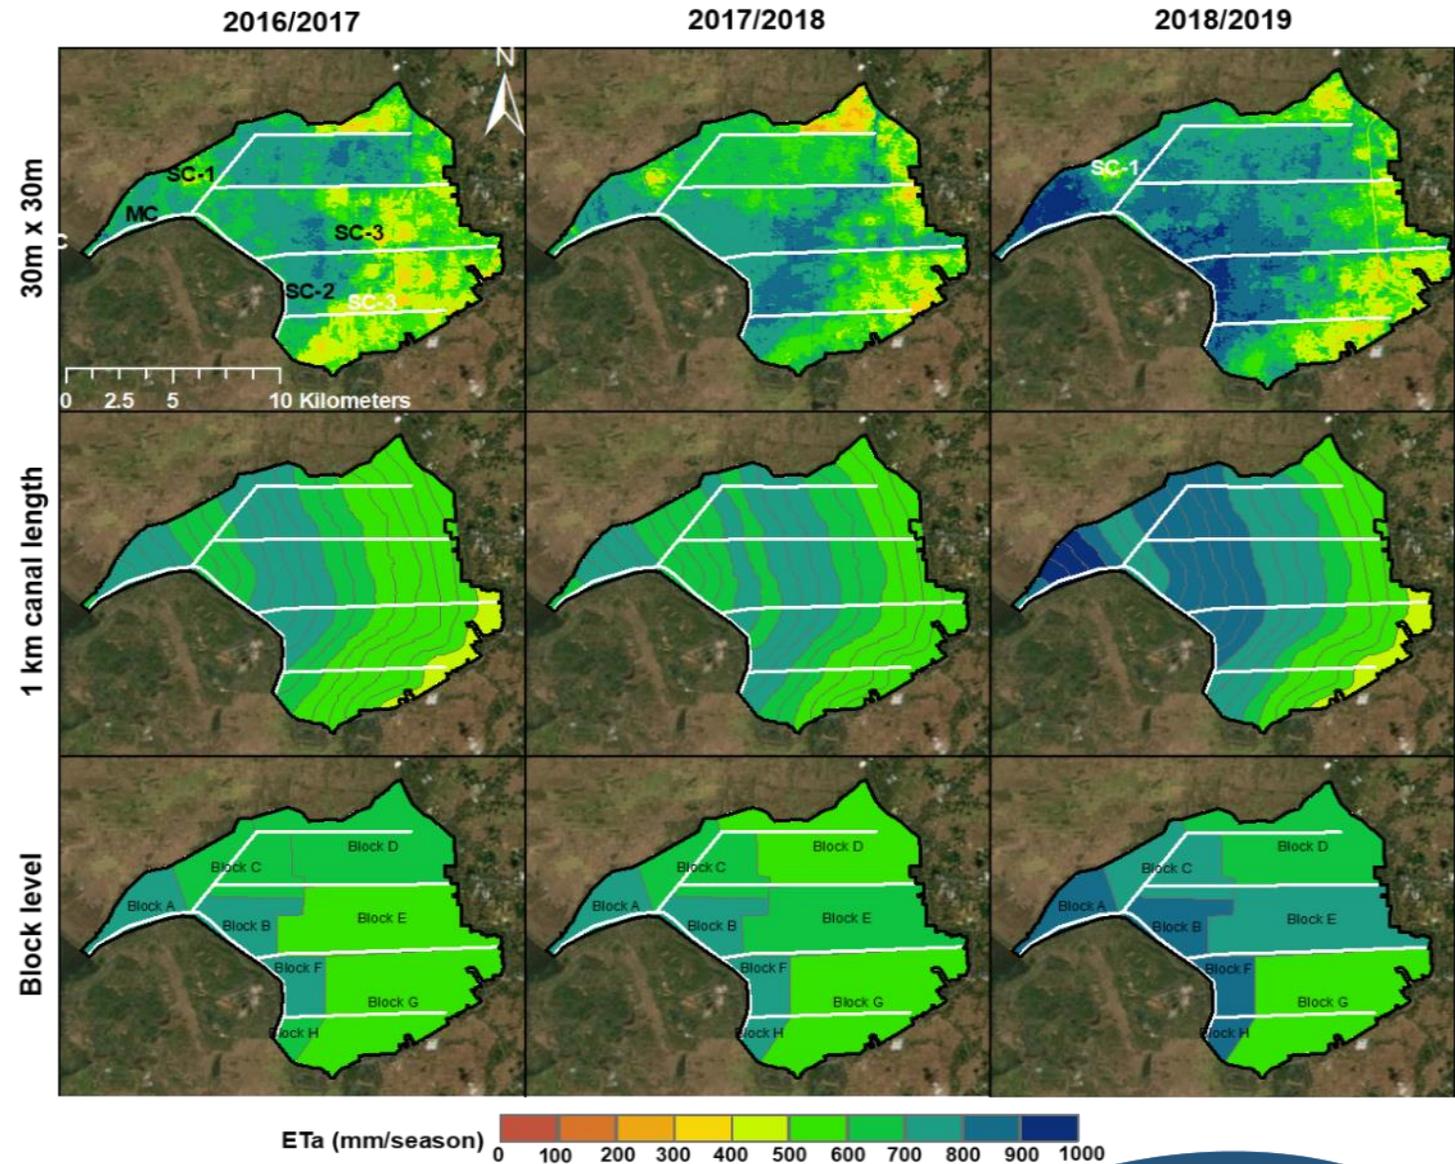

Lunugamwehera Irrigation scheme

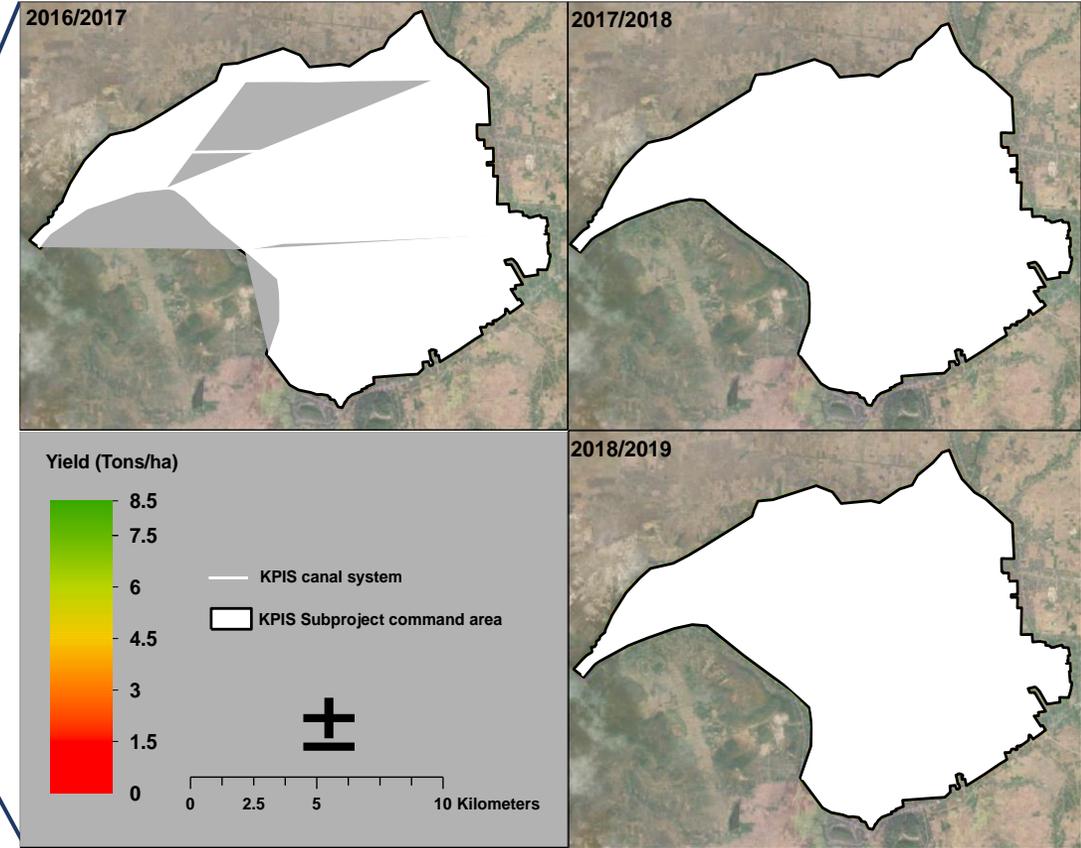

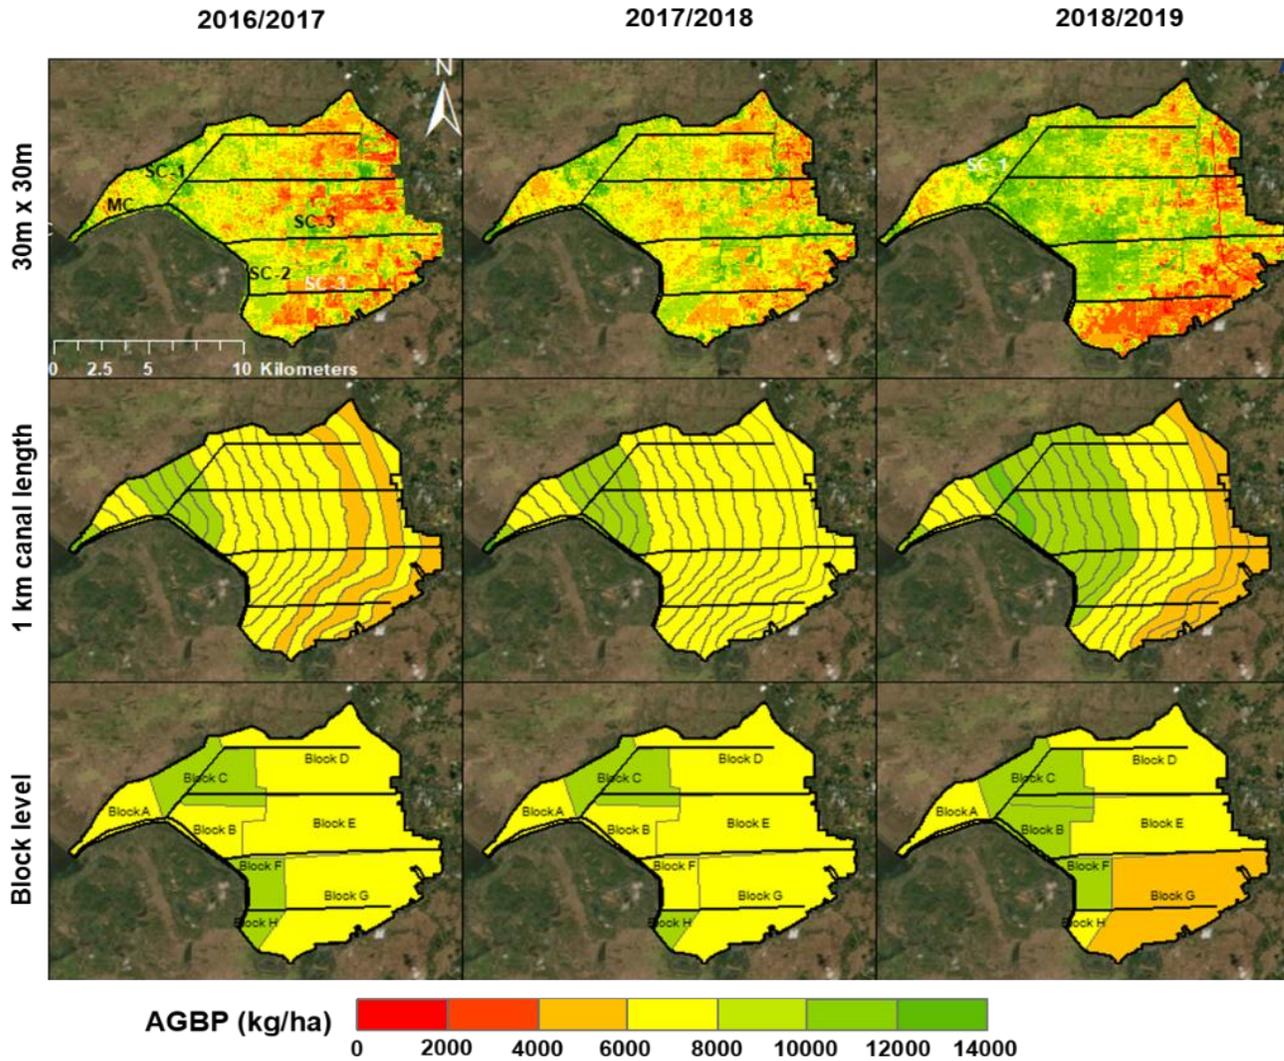

Kamping Pouy, Cambodia

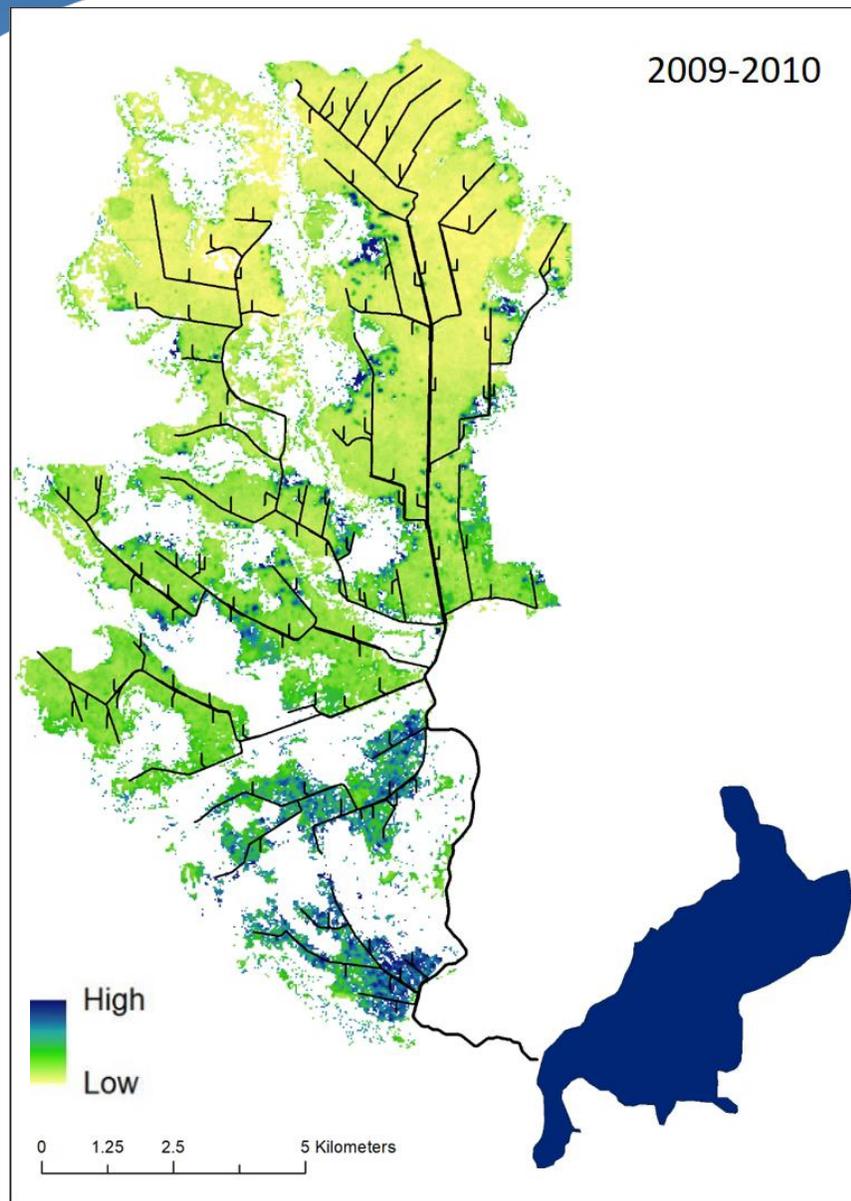

- Reservoir - 139 MCM
- Total command area - 19,000 ha
- Irrigation season - Dec to Apr
- Paddy rice

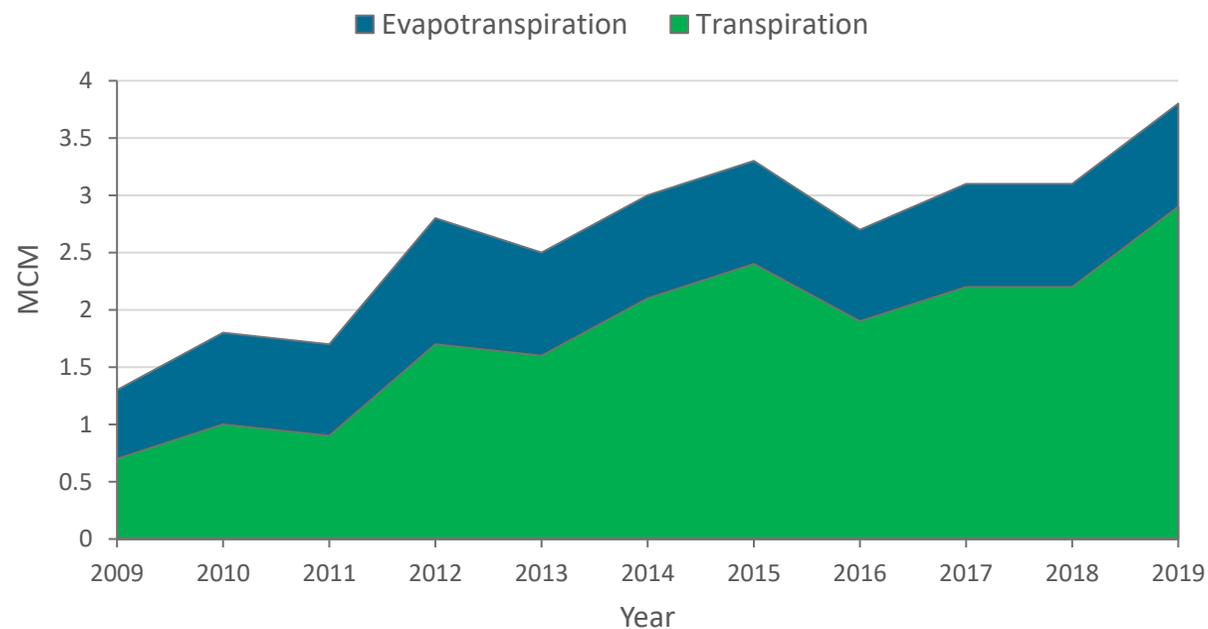

Kamping Pouy, Cambodia

Understanding water delivery:

Performance indicator	Good	Fair	Poor	Head		Mid		Tail	
				Kudmi	Chihona	Adibera	Tagel	Andinet	Teleta
Adequacy	0.9<x<1.1	0.7<x<0.9	<0.7 of >1.1	1.02	0.91	1.17	1.14	0.97	0.84
Equity	<0.1	0.1<x<0.25	>0.25	0.14	0.14	0.18	0.04	0.19	0.36
Reliability	<0.1	0.1<x<0.2	>0.2	0.1	0.31	0.27	0.05	0.23	0.05

- Adequacy, equity and reliability differs among blocks which influences when water is available to irrigators
- The scheme functions on a rotational basis depending on crop (8-10 days)

Reducing water applied and increasing yields:

Key messages:

By integrating the outputs from the remote sensing analyses with ground level data, we are able to provide a powerful suite of decision support tools which collectively contribute to:

- Improved benchmarking
- Better asset management
- Targeting of investments and selection of priority assets/blocks/schemes
- Identification of areas of decreasing performance related to water availability, governance and/or productivity
- Address issues before they become critical

➤ In combination these tools can be used to improve the planning, design, and management of irrigation systems
