

Digital challenges

What it takes for decision-makers to harness digital technologies for managing climate risks effectively.

Jawoo Koo

Senior Research Fellow
Environment and Production **Technology** Division
International Food Policy **Research** Institute

*Research-based policy solutions
that sustainably reduce poverty
and end hunger and malnutrition.*

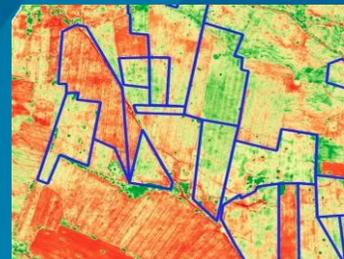

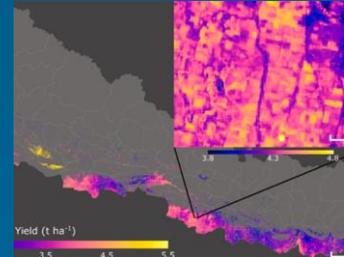

Opportunities and challenges

Digital opportunities

- Real-time monitoring data.
- Predictive analytics to plan protective measures.
- Improved public information systems, digitally connecting stakeholders and monitoring policy impacts.

Challenges

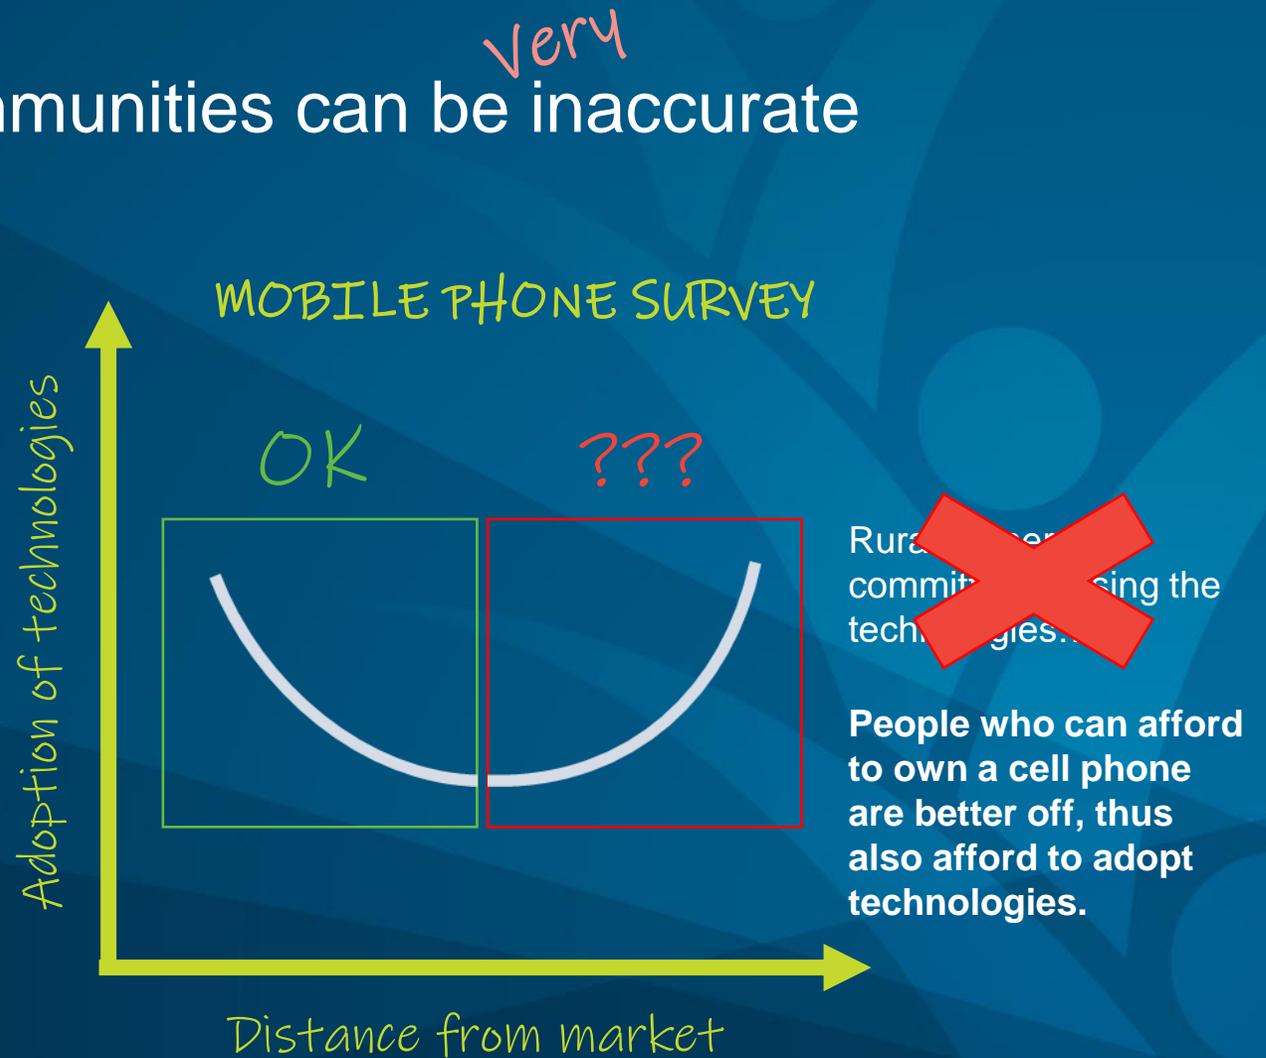

- Digital divide
Digital infrastructure does not reach those who can benefit the most.
- Inadequate information
Decision-makers lack access to timely, reliable, and actionable information.
- Limited capabilities
Digital capabilities need to strengthen to best utilize data and information for making evidence-based decisions and actions.

Digital divide

What we know about rural communities can be inaccurate

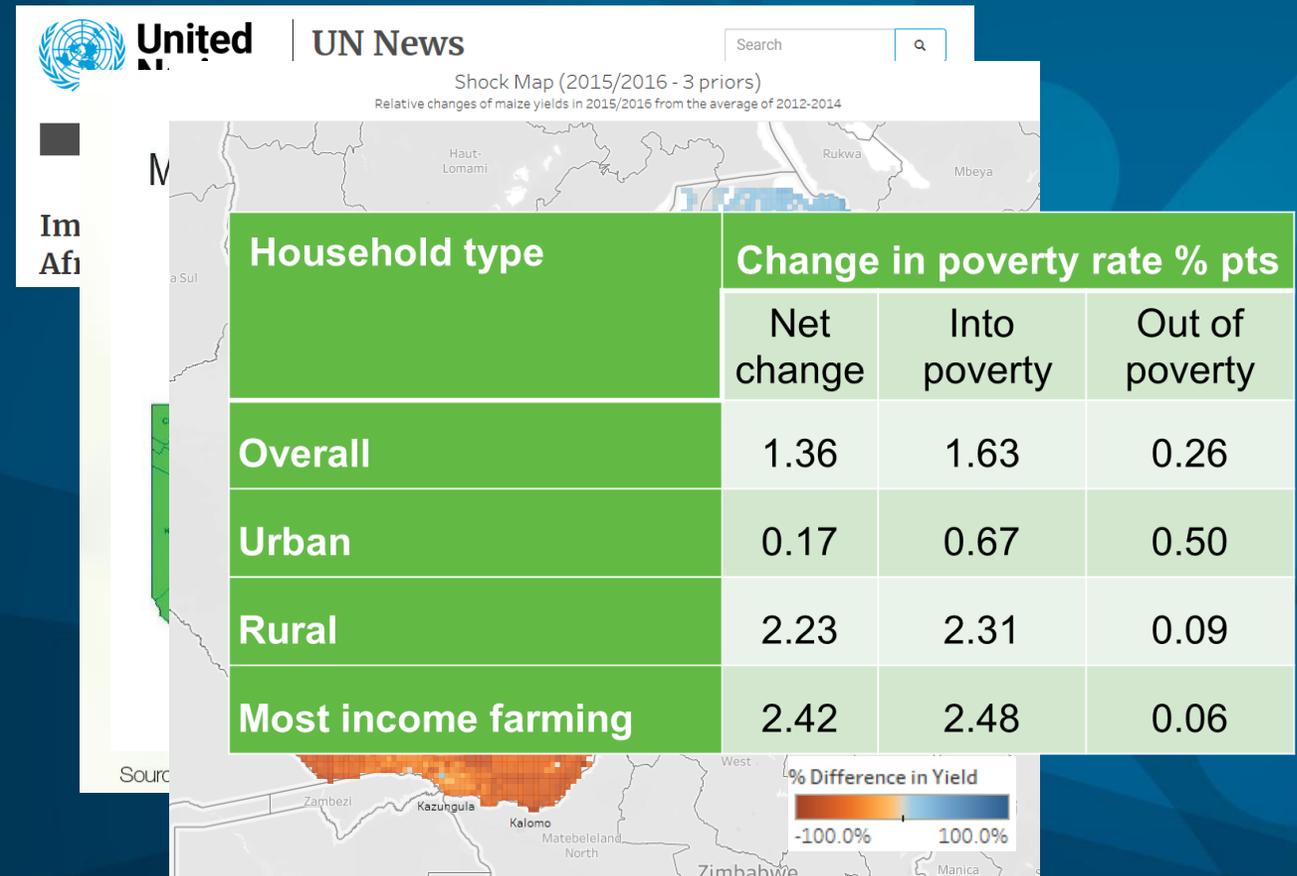

- The potential of digital technologies is clear, yet its reach is not universal.
- Rural communities are often underrepresented in information systems.
- Strategies for collecting groundtruthing data (i.e., sampling frames) should be carefully evaluated and continuously revised to ensure the rural population is properly represented.

Inadequate information

Decision-makers lack timely, reliable, and actionable information

- Weak information systems waste budget, exacerbate poverty, and slow economic growth.
- Existing knowledge is often outdated and difficult to apply in practice.
- Siloed data do not support evidence-based policy responses that can manage food system risks such as price hikes, pest infestations, floods, and droughts.

Limited capabilities

Technology should be supplemented by investments in capabilities

- Investments in “soft” infrastructure are critical to building analytical skills and fully utilizing new information for decisions.
- Digital literacy levels are low for the marginalized, food-insecure communities, and especially women.
- Beyond promising pilots, research and co-design are needed to channel new data and evidence to decision-makers’ effective management of climate risks.
