Resilient City Toolbox for Urban Resilience Planning

Frans H.M. van de Ven

in cooperation with

Reinder Brolsma and Helena Hulsman

11 August, 2020

Table of contents

- **Deltares in brief**
- **Resilient City Toolbox for Urban Resilience Planning**
- Urban resilience (from a water perspective)
 - Numerous reasons to strengthen urban resilience
 - Hazards and challenges
 - Opportunities for using water as a resource
- Resilience planning
 - Step 1: Vulnerability assessment
 - Step 2: Strategy
 - Step 3: Adaptation planning
- Planning support tools
 - Resilient City Toolbox
 - Application examples
- **Q&A**

Deltares in brief

- We are working on **smart innovations** in the field of water and subsurface
- We are **the knowledge partner** of the Dutch government.
- We make our knowledge applicable **worldwide**
- We are a **strategic partner** and **trusted advisor** internationally.
- We provide **specialist consultancy** internationally.

Number of employees

*University / Ph.D.
39 nationalities*

*Regional offices in
Abu Dhabi, Singapore
and Indonesia*

Net turnover

Urban Resilience (from a water perspective)

Urban Resilience

Resilience:

*the capability of a society to
prevent or cope with the
impacts of climate change and
sea-level rise, including
technical, institutional,
economic, and cultural ability*

Discussions often focus on

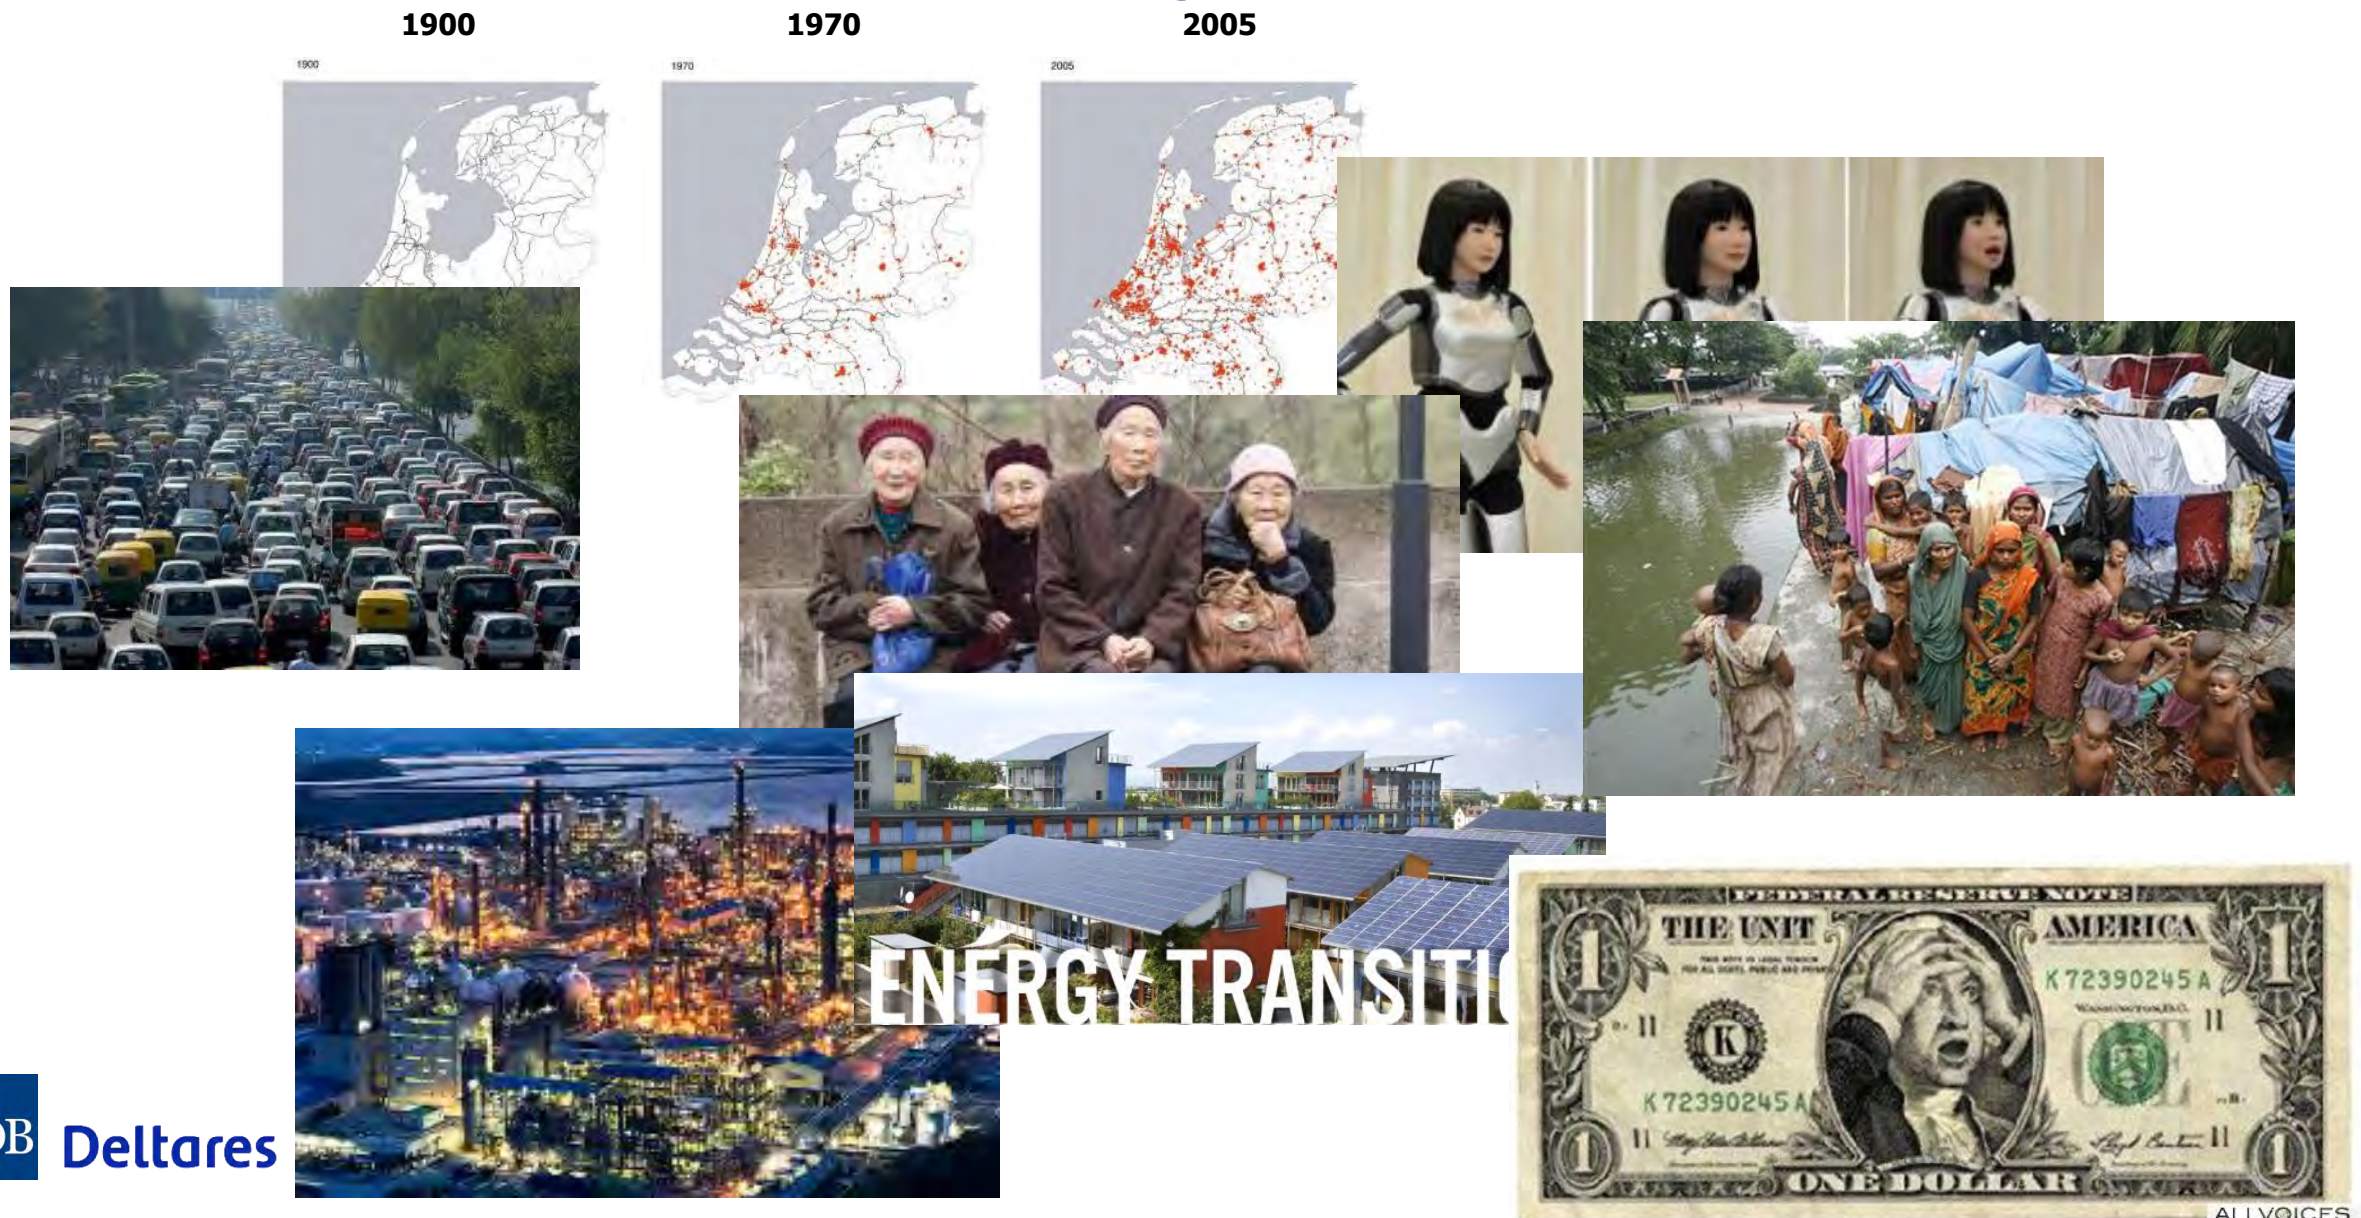

*‘too much, too little, too dirty, too
compartmentalized and not for everyone’*

That is why we look through **five lenses** at urban resilience:

- **flood risk management**
- **drought**
- **water quality**
- **integrated design and**
- **inclusiveness.**

Numerous reasons to strengthen urban resilience....

...as well as flooding, drought and heat

Not only threats and challenges,

**also many OPPORTUNITIES
to use WATER as a RESOURCE
to improve urban resilience**

Water harvesting

Water surface to live & work on/in/above

Water and green for biodiversity and food production

Water and green for recreation and wellbeing

Water for cooling and heating

Resilience planning – a tiered approach

Three steps:

- 1: Vulnerability scan (“stress test”)
- 2: Strategy to reduce vulnerability and set targets
- 3: Select set of adaptation measures

Step 1, including: Flood hazard assessment

Step 1, including: Governance analysis

e.g. SWOT analysis of the governance-chain
using the PRIMO-chain approach

Step 2, including: Retain – Store - Drain strategy

Retain and Detain and Store **at the source** to avoid overloading the drainage capacity

CLIMATE ADAPTATION IN THE NEW DEVELOPMENTS IN THE ZOHO-DISTRICT

De Urbanisten

LOD (Lokalt omhändertagande av dagvatten)

http://www.chinadaily.com.cn/opinion/2017-09/26/content_32491069.htm

Step 2, including: Multi-level protection strategy

Level 3:
Flood warning and emergency plans

Level 2:
Flood robust spatial planning

Level 1:
**Flood protection for coastal and fluvial
flooding**

Step 2, including: Three point approach for resilience

Step 2: Blue-green / nature-based solutions preferred

Grey solutions

Nature-based solutions

less space required

more space needed

less flexible, extra investment

flexible and cost-effective

Step 3 Adaptation planning

Selecting the best set of adaptation measures

Selection and planning process

- EbA, Blue-green solutions, Nature-Based Solutions, Green infrastructure, grey solutions, SuDS,
- Many options => hard to make choices

Step 3 Adaptation planning

Collaborative planning / co-design of solutions

- **Many different fields of expertise** required, e.g. urban planners, drainage experts, road engineers, landscape designers, project developers, housing experts, economists, etc.
- **Stakeholders** to be involved (residents, businesses) to get support for the plan by all stakeholders and political decision makers
- **Location specific solutions** are developed, using local knowledge and preferences
- Discussions are focusing on **opportunities, benefits and co-benefits** of specific interventions
- **Benefits are maximized** while risks are minimized

Planning support tools

Required:

- Should facilitate and structure discussions
- Fit the structure planning & design process

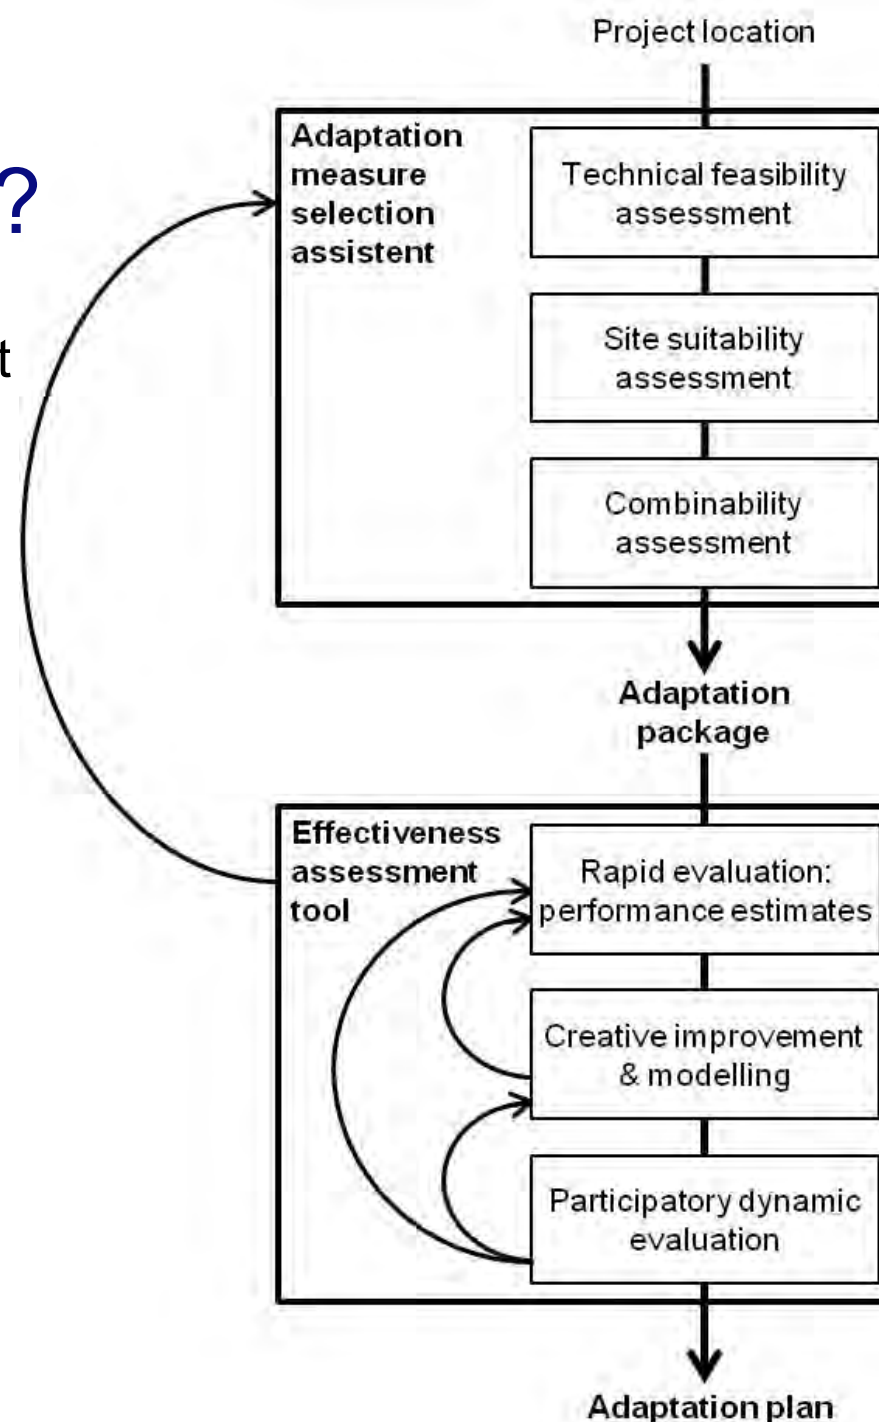

What is the Resilient City Toolbox meant for?

- **Support dialogue** with all stakeholders (experts, local representatives, constructors, financiers, etc.) **about options and alternatives**; which adaptation measures can be implemented, where, and how?
- Provide **first estimate of hydrological effectiveness and costs** of a proposed adaptation measures for extreme rainfall, drought, heat and water quality, so that these aspects become an explicit part of the planning process.
- Results are shown on a **map**, which then becomes **input for a detailed design** by landscape architects and urban planners.

How is the Toolbox built up?

Indicators of effectiveness of measures

Adaptation goal	Key performance
Pluvial flooding	Storage capacity [m ³] Return time factor [-]
Drought reduction	Groundwater recharge (infiltration) [m/y]
Heat stress reduction	Evapotranspiration [mm/y] Cool spots [-]
Water quality improvement	Pathogen reduction Nutrient reduction Adsorbed pollutants reduction
Cost	Construction cost Maintenance cost

Effectiveness calculations with urban water balance model

Effects of the adaptation measures determined by means of a **multi-reservoir water balance rainfall-runoff model**

based on (ideally) long (30 years or more) time series of meteorological data, using hourly time steps.

- **Hydrological boundary conditions** of the water balance model are based on local conditions

Same model to assess target 'sponge capacity'

Input:

- land use data
- soil property data
- long series rainfall data
- long series evaporation data
- climate change assumptions

Urban
Water
Balance
Model

Output:

- discharge capacity
- long series of stored volumes

extreme value statistics

Storage – Discharge – Frequency
(SDF) curves

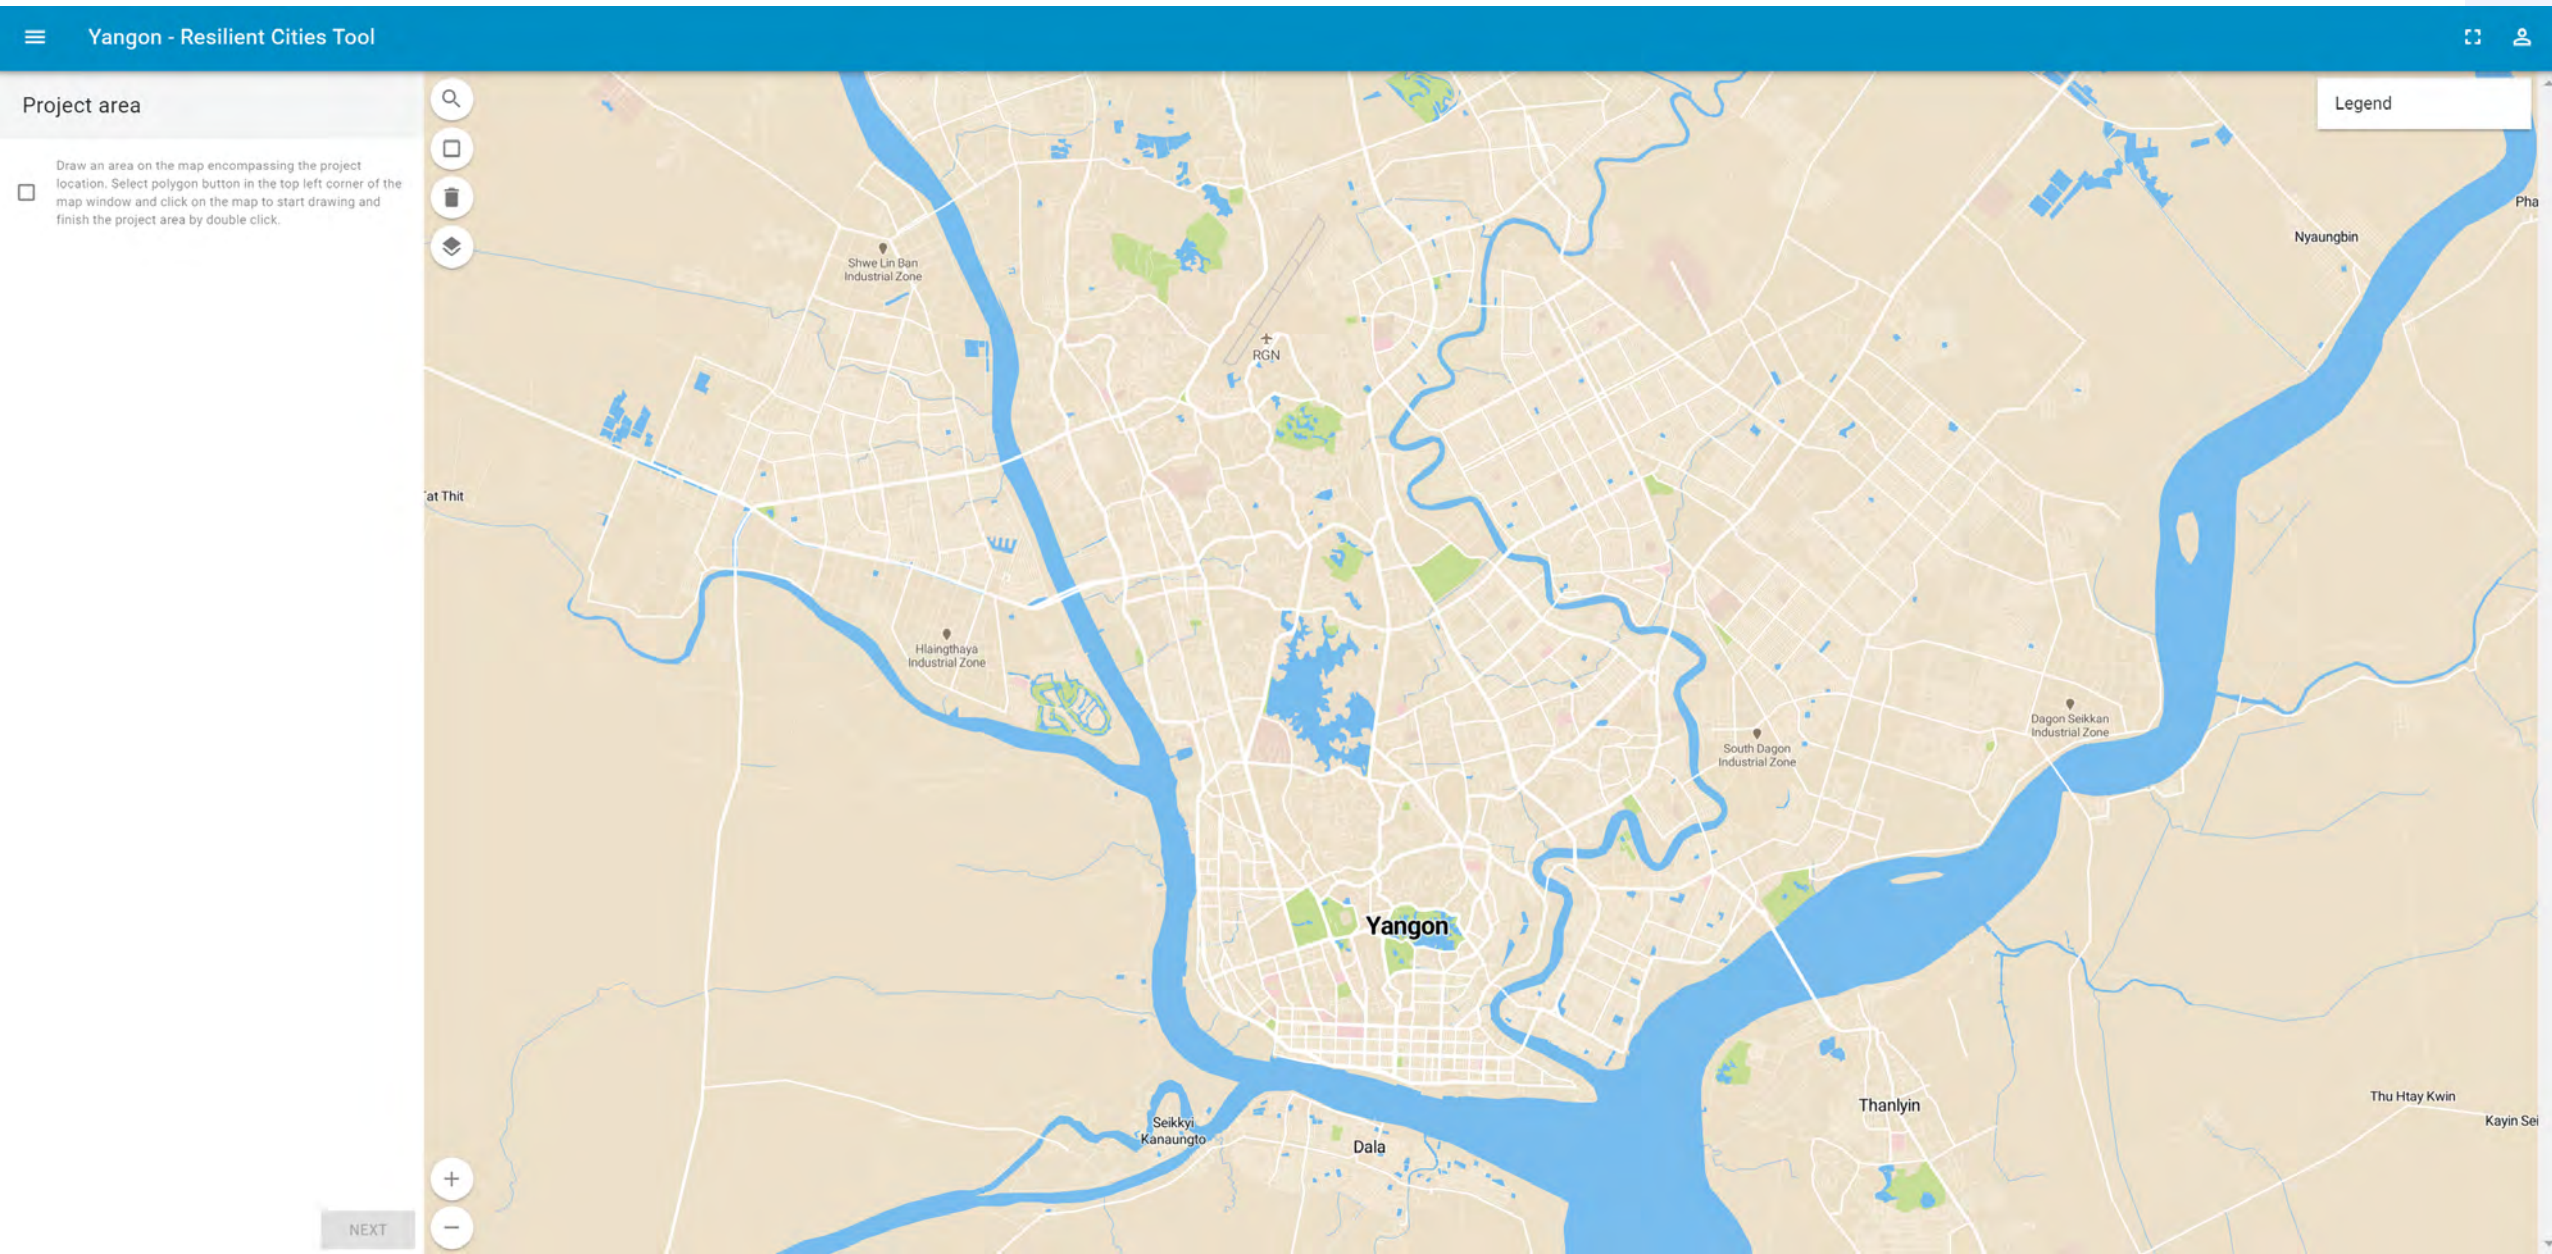

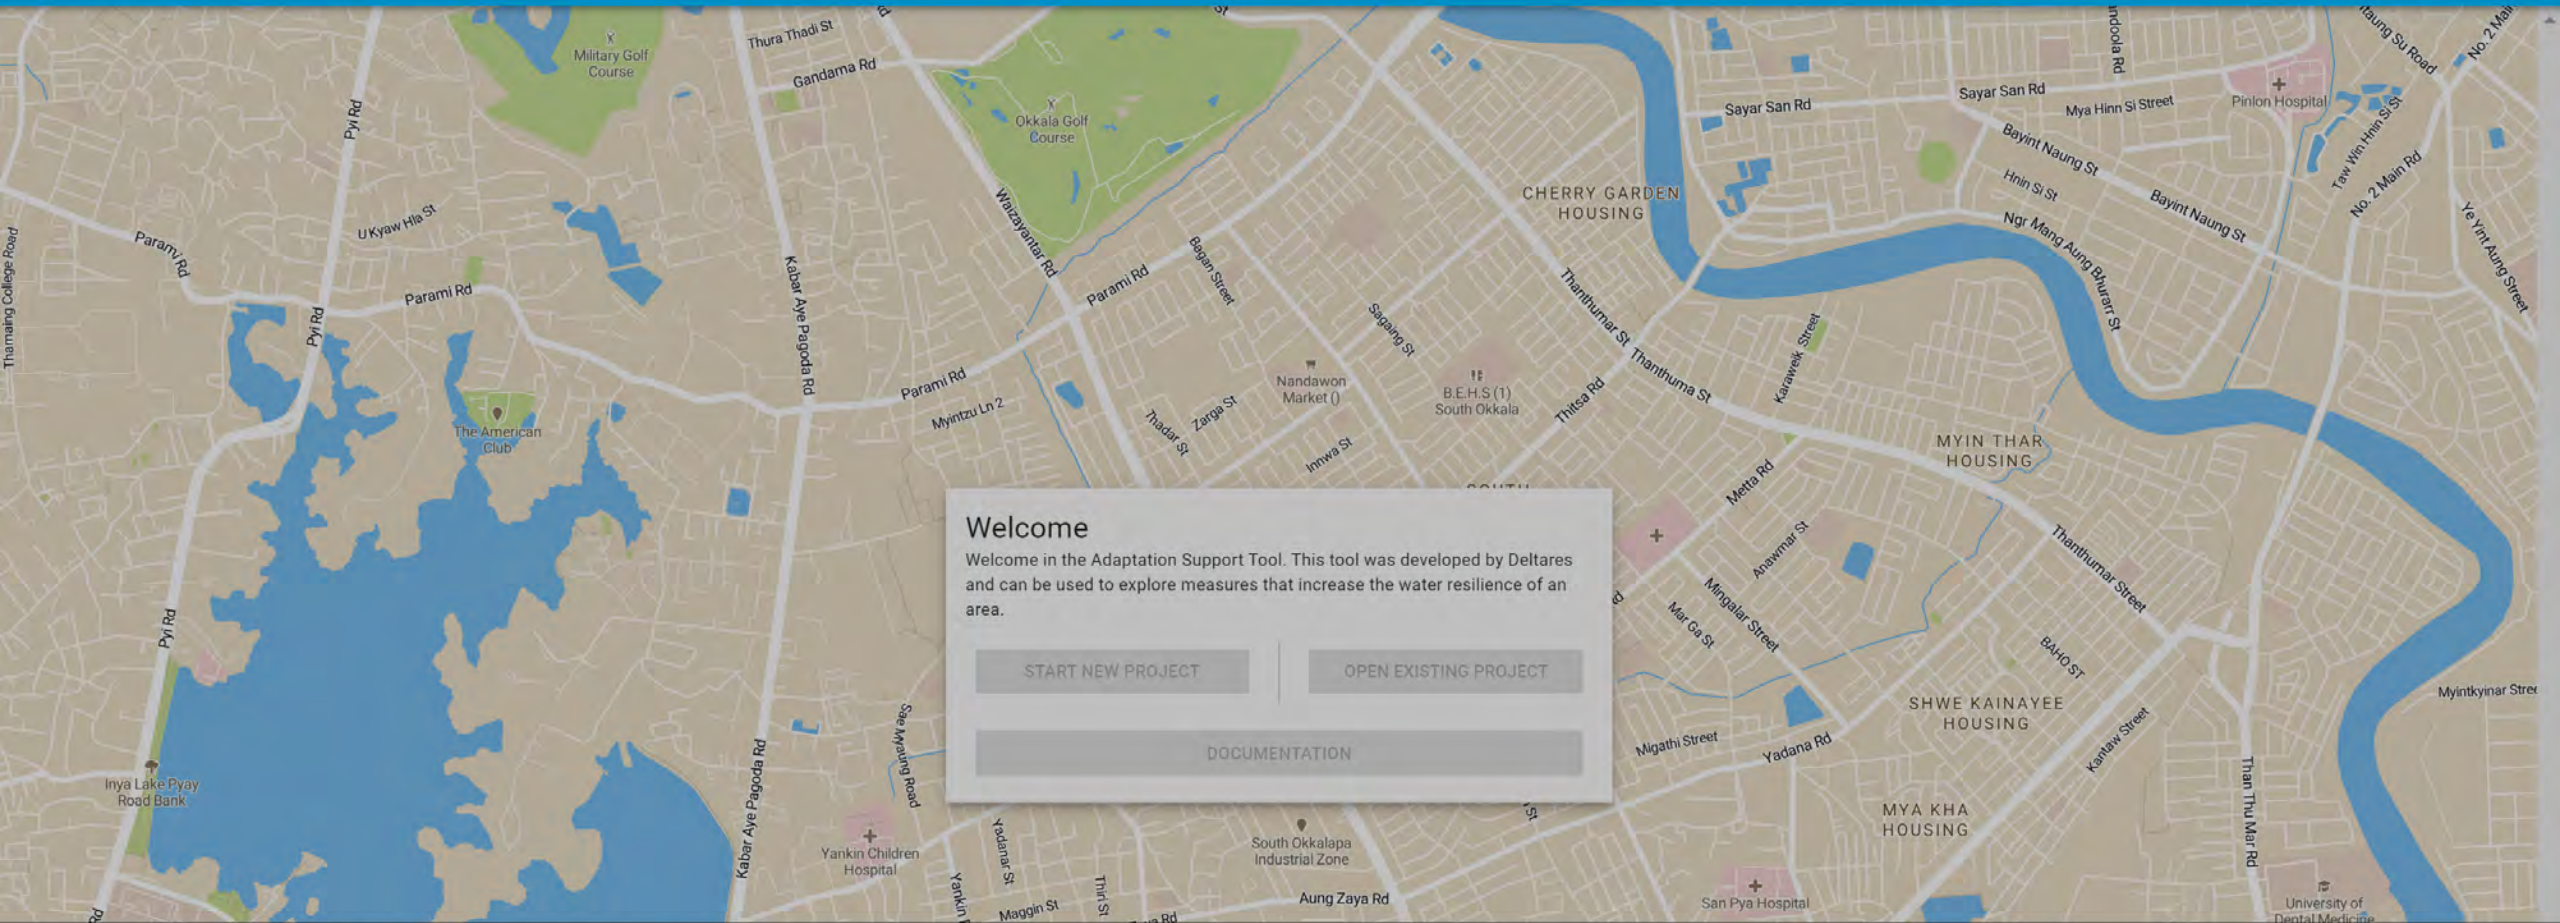

Using the Climate Resilient City Toolbox online

Available on: <https://crctool.org>

- **Web-based**; no software installation required; project data stored on own PC
- **Customize** Toolbox for local conditions (climate, costs, applicability criteria,...)
- **Explore** alternatives and **co-create** plans
- **Export** the map and corresponding effectiveness results

Toolbox Klimaatbestendige Stad (Climate Resilient City Toolbox) website User Agreement

You can print and file this legal agreement on the user terms and conditions of this Toolbox Klimaatbestendige Stad (Climate Resilient City Toolbox) website (hereinafter "User Agreement"), e.g. prior to accepting these terms and conditions.

Please read this User Agreement carefully.

This is a legal agreement between you, acting on behalf of a legal entity, and Stichting Deltares (hereinafter "Deltares"). The use of this Toolbox Klimaatbestendige Stad (Climate Resilient City Toolbox) website and of the resulting outcomes of its use (e.g. a data-file) is subject to the conditions of this User Agreement as set out below. The website and the resulting outcomes of its use are hereinafter jointly referenced to as "Website".

By marking the "I Agree"-checkbox:

1. You expressly declare being authorized to act on behalf of the legal entity (hereinafter "User") you represent for the purposes of accepting this User Agreement;
2. User expressly accepts this User Agreement and accepts to be legally bound by the terms and conditions contained therein.

If you are not authorized to act on behalf of User to agree upon this User Agreement, please do not mark the "I agree" checkbox and exit this Website. Furthermore do not mark the "I Accept" checkbox and end the visit to this Website if User does not agree with the User Agreement.

Project area

Draw an area on the map encompassing the project location. Select polygon button in the top left corner of the map window and click on the map to start drawing and finish the project area by double click.

Rainwater detention pond (wet pond)

Pluvial flooding Drought Heatstress

Buffer ponds temporarily capture precipitation and allow it to drain off slowly. During rainfall, the rainwater is captured in the pond and subsequently drained off to create room for the next precipitation. Buffer ponds can be designed to have a mostly stony or a mostly natural appearance.

Documentation

This guide explains the use of the Adaptation Support Tool 2.0 going through the initial setup and configuration step by step. More detailed information on the tool can be found [here](#).

First, read, discuss and accept the disclaimer and copyrights. All participants have to understand and agree that the results of the AST are merely indicative and cannot be used for final design and decision making. After accepting the disclaimer and copyrights you can start using the tool.

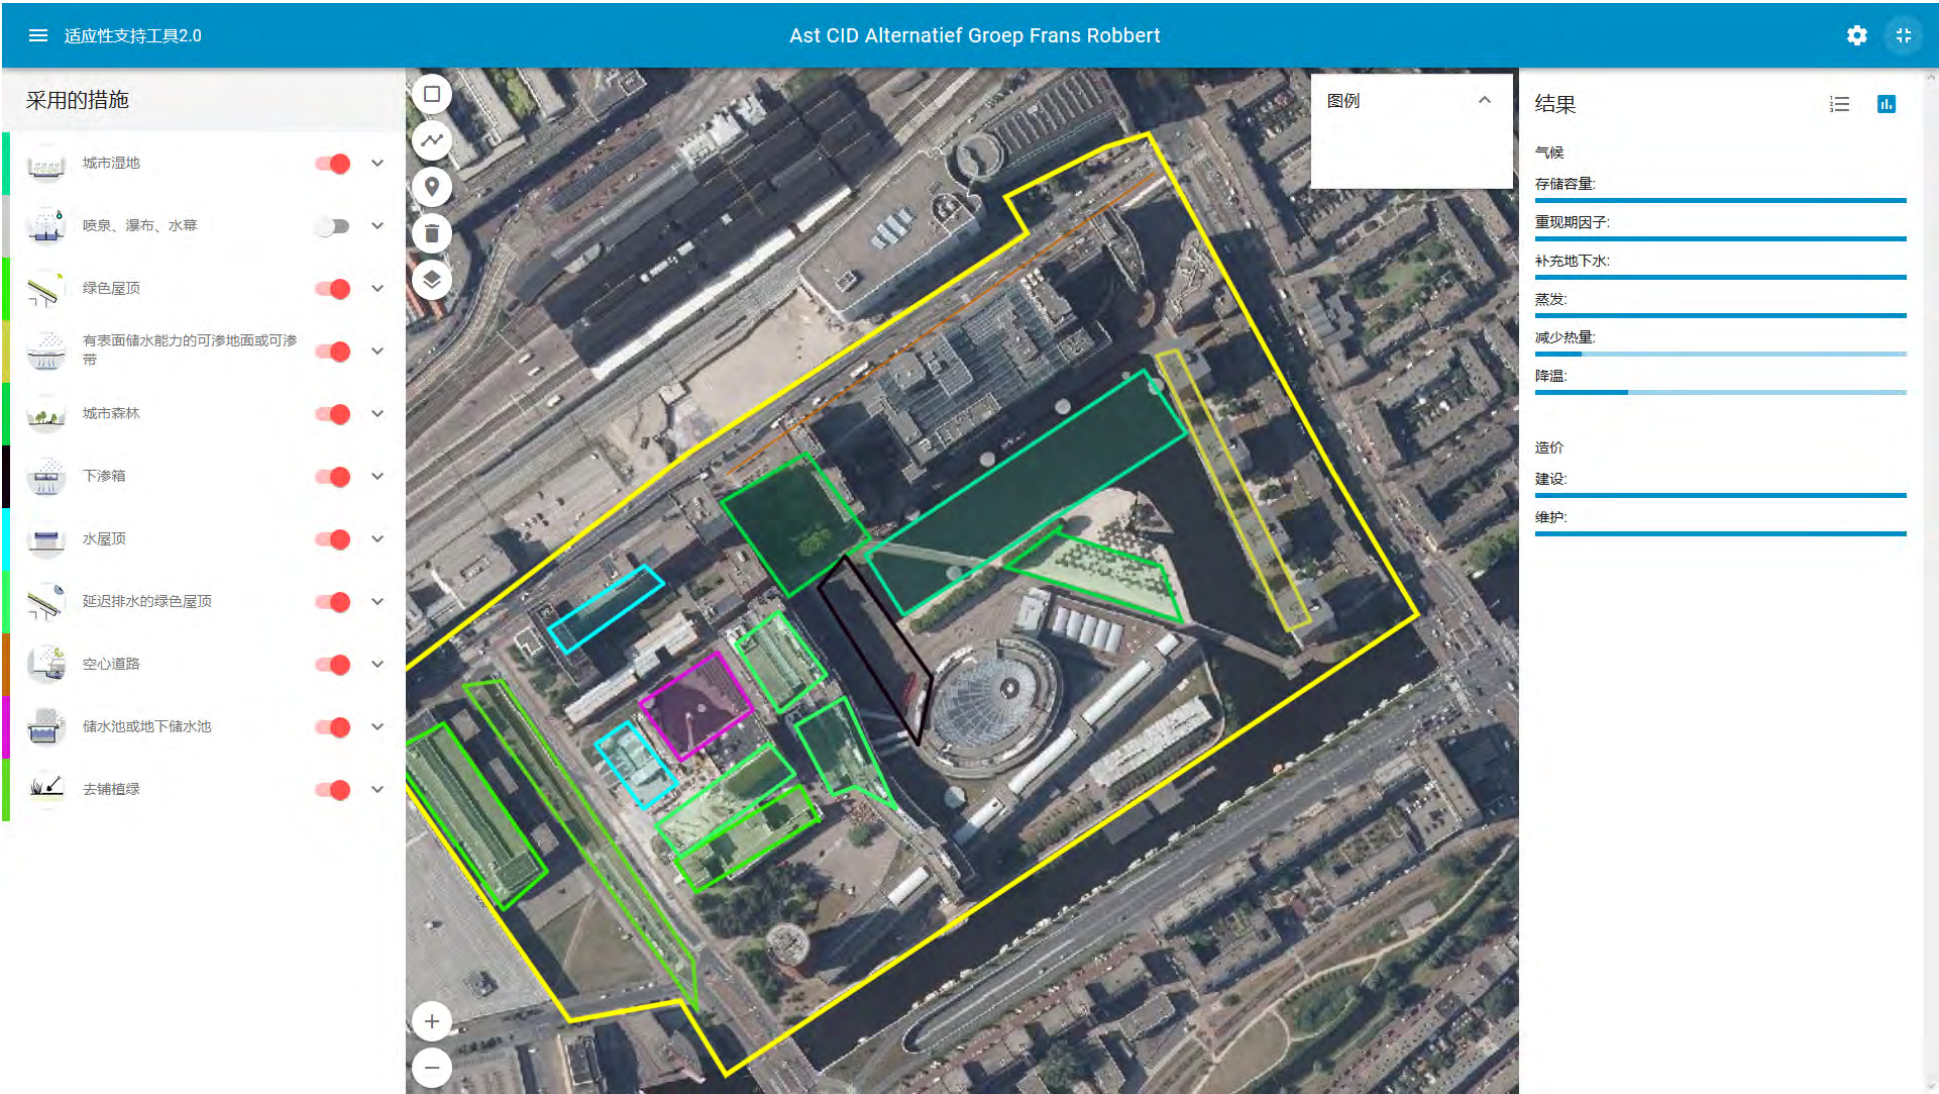

To use the AST for the first time, select *Start a new project* or, in case you already have a saved project select *Open existing project*.
