Challenges Overview

- In many water utilities, assets are increasingly stressed from overuse, underfunding, and aging.
- Managing these assets, identifying assets most likely to fail, and getting real-time insights from your system are tasks that are hard to accomplish.
- Practical, advanced techniques for better managing physical assets have been developed and GeoViewer software can help utilities build a Real-time Digital Twin Asset Management solution.

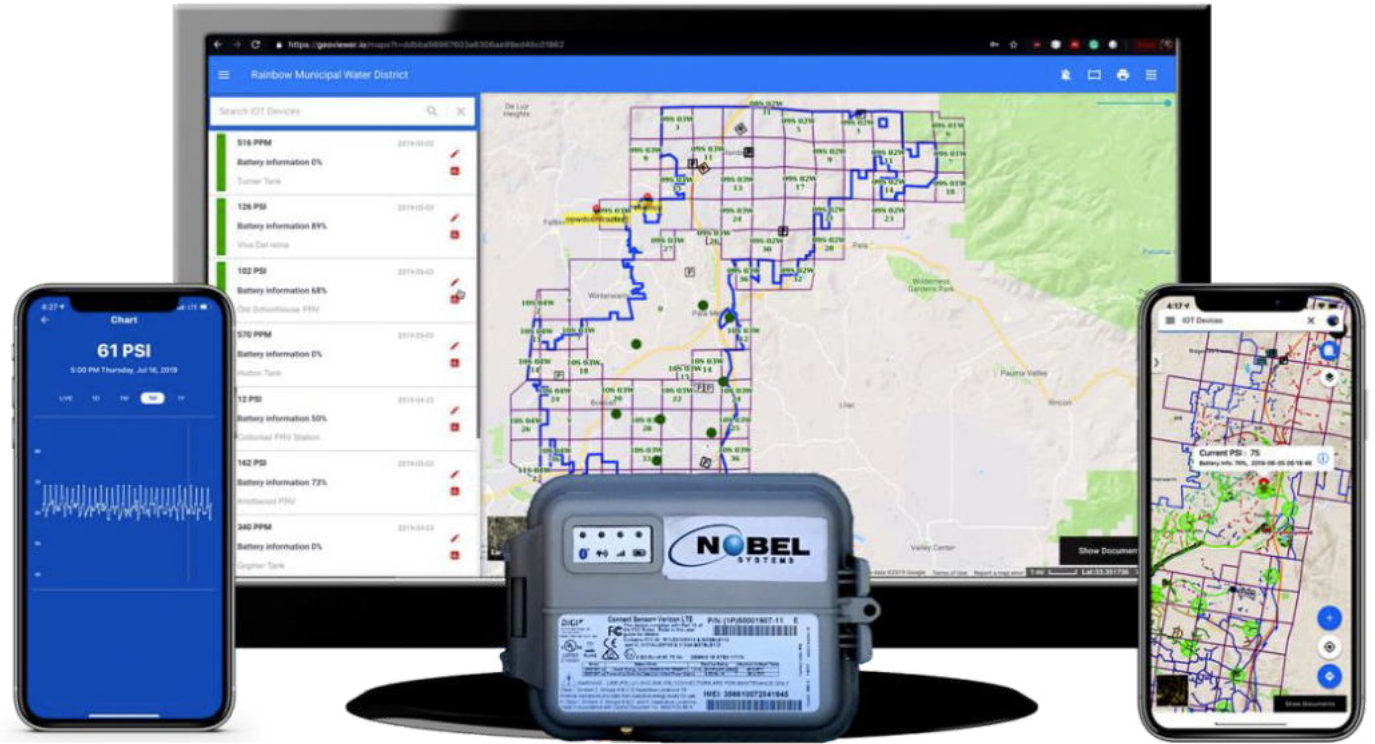

Who We Are

- Founded in 1992, and headquartered in Redlands, California, Nobel Systems Inc. has enjoyed relationships with our clients across the world and encompassing thousands of users. Many of our relationships with our customers have lasted over a decade.
- With 25+ years working in the water industry, Nobel Systems continues to deliver real-world solutions that integrate with your existing network and devices.
- Our cloud-hosted SAAS-based Asset Management solutions called **GeoViewer** provide easy access to your data with minimal training and no additional software.

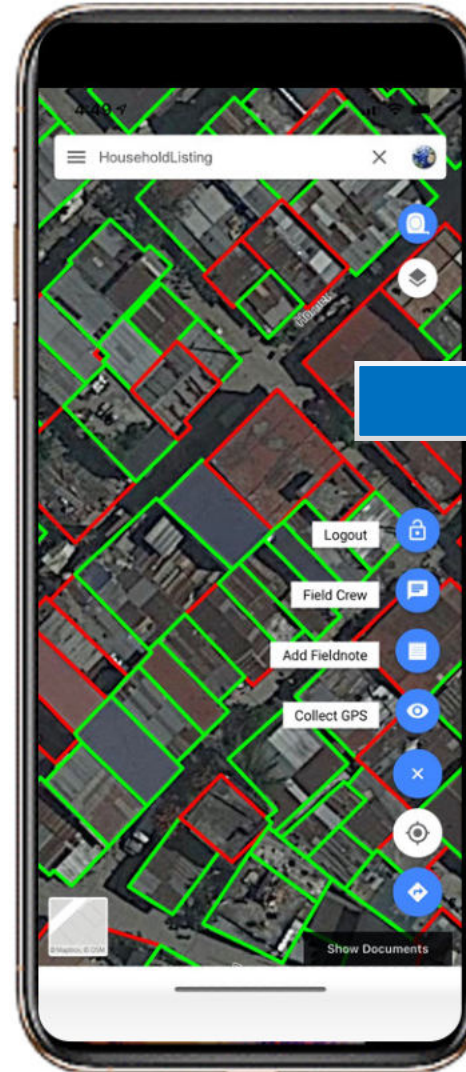

What is GeoViewer?

- A Real-Time, Total Operations Management Solution for Utilities
It isn't just an Asset Management System.
- It creates a **DIGITAL TWIN model** of the network by utilizing:
 - **Water GIS data**
 - **IoT sensor data**
 - **Maintenance data easily gathered from GeoViewer mobile and web apps**
 - **Calibrated hydraulic models and machine learning algorithms to output unique insights**
- A proven solution with customers in United States, Philippines, and Uzbekistan

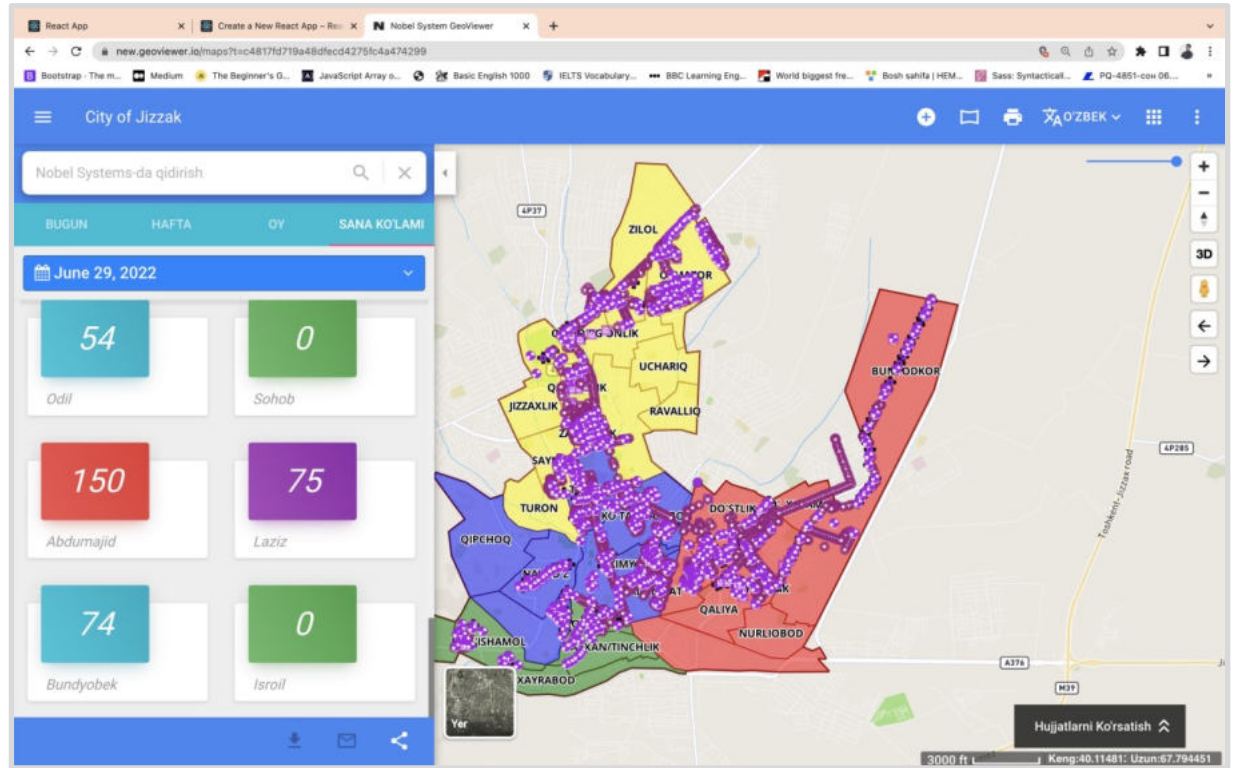

Create a Computer Mapping System (GIS)

- 1) The first step in any remote monitoring of water utilities is to create a GIS system of the utility. Nobel Systems has several years of experience in building such a system especially in countries such as the Philippines and India where data is not easily available.
- 2) Digitize the parcels from satellite images and transfer that data to a tablet.
- 3) The field staff take the tablet in the field and start to capture meters, valves, and other assets. The data is automatically transferred to the GIS and the staff start connecting the dots to build the water network.
- 4) This is again field verified to check for accuracy. We can also import existing data if available into the system.
- 5) Finally, the map is created.

City of Jizzak, Uzbekistan Collecting Field Data

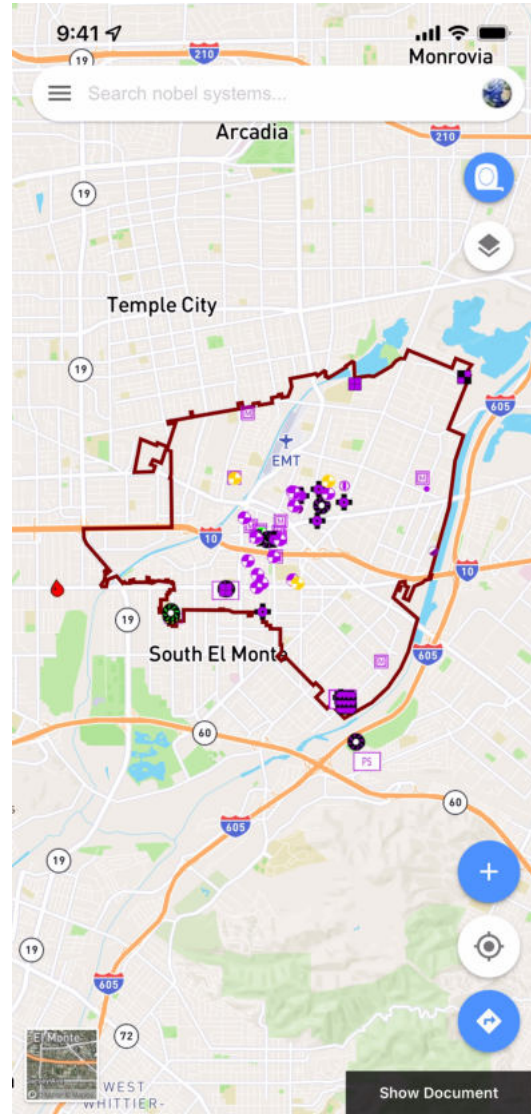

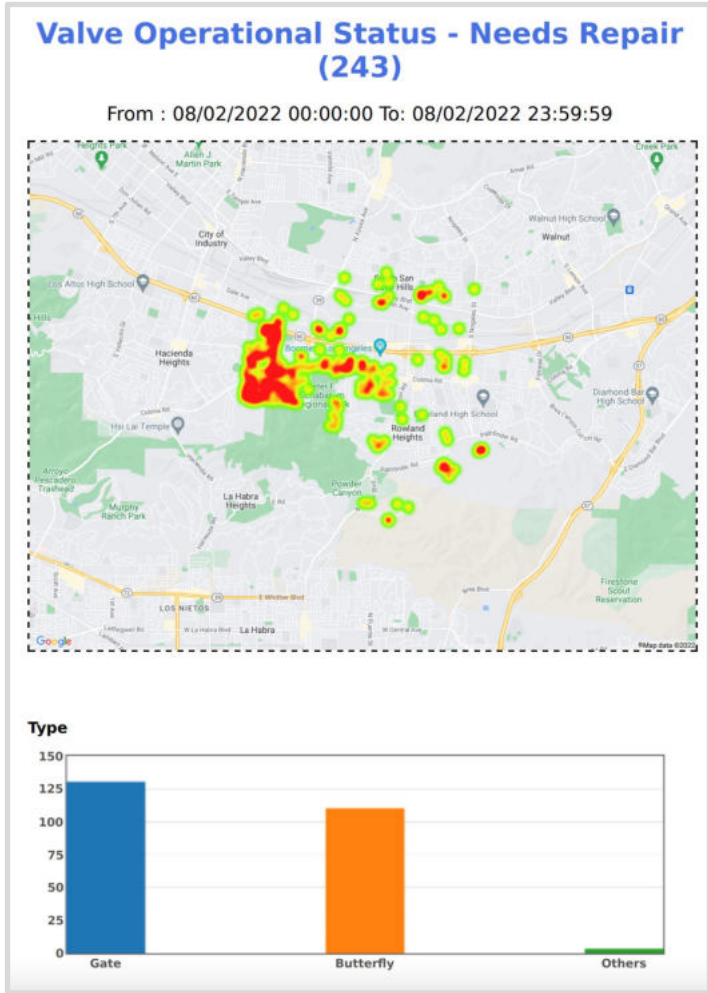

Preventative Maintenance and Work Orders

- **Preventative Maintenance (PM)** is a key component within an Asset Management strategy.
- Preventative Maintenance ensures peak efficiency and minimizes deterioration of a piece of equipment.
- Once the GIS has been completed, utilities will use GeoViewer for preventative maintenance:
 - Maintain assets on a schedule
 - Flag assets for repair
 - Create Work Orders to fix assets

Show Assets Likely to Fail

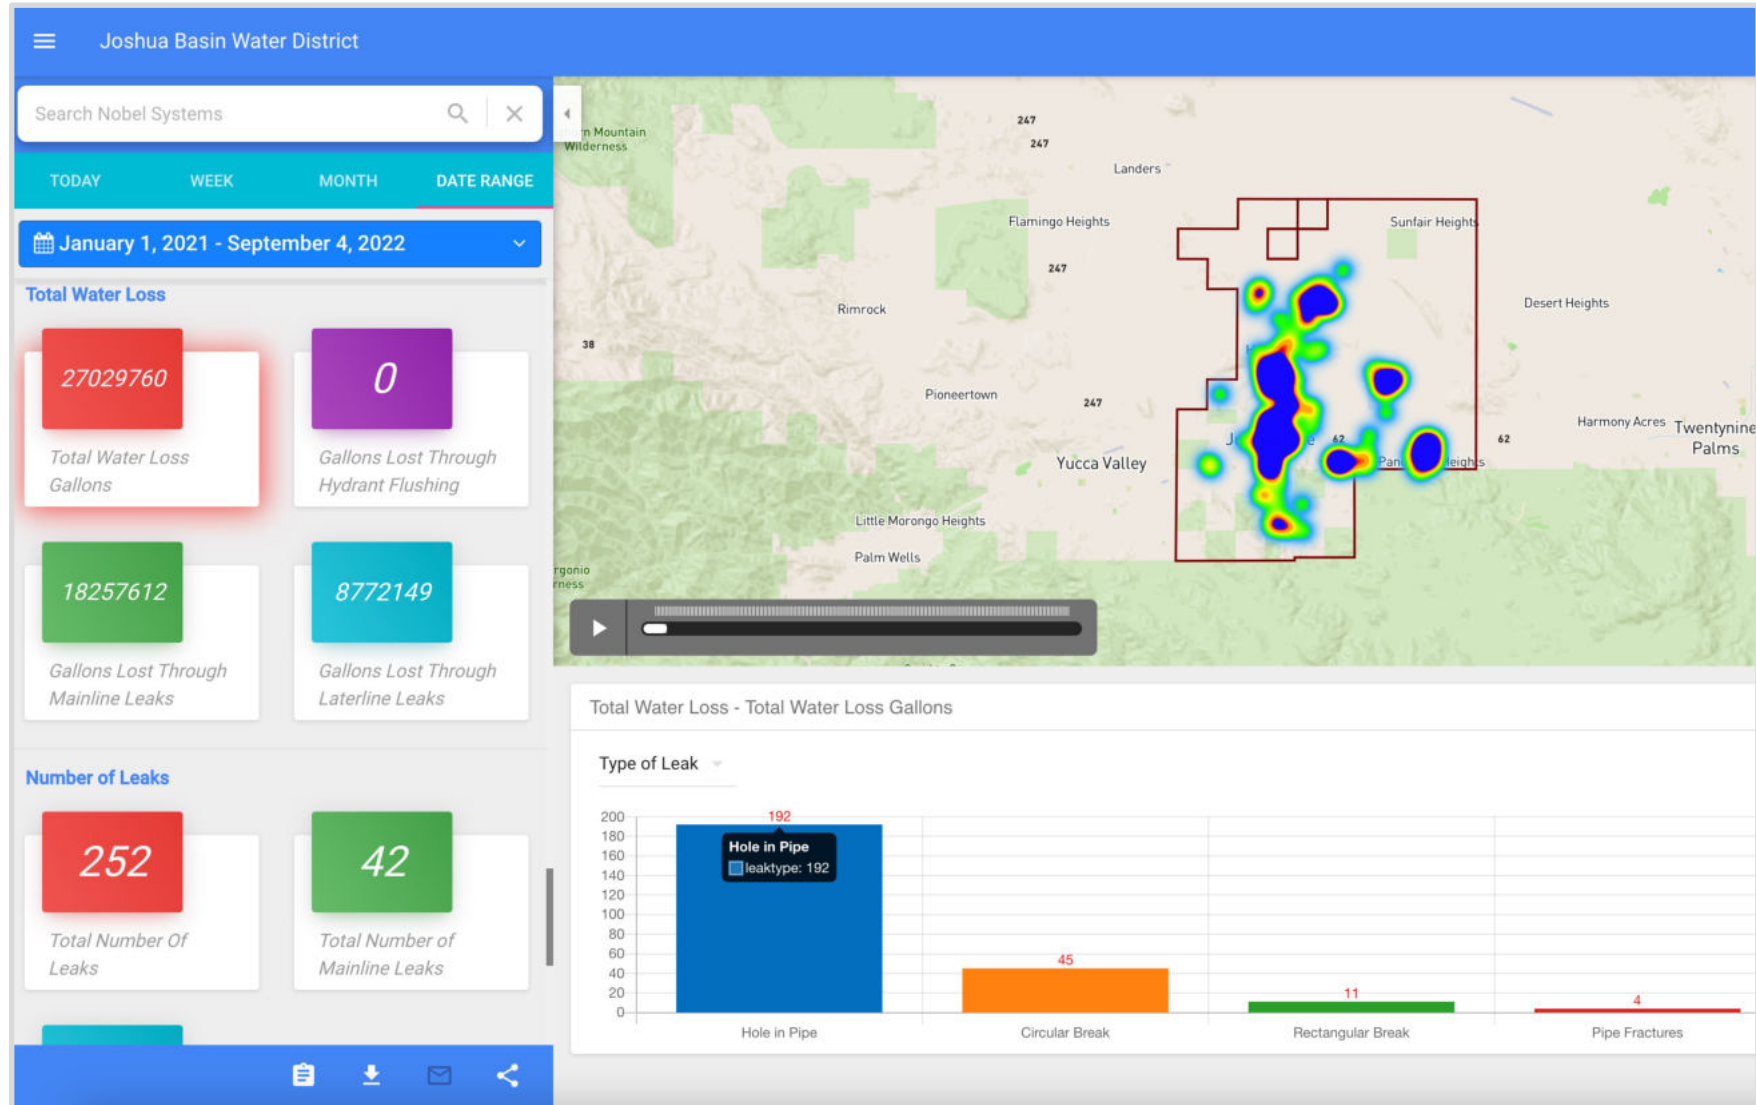

The screenshot displays the GeoViewer application interface for the Rowland Water District. The top navigation bar includes a search function for Nobel Systems and a date range selector set to 2022-08-02. The main dashboard features several key performance indicators (KPIs) for valve operational status:

- Inoperable:** 89
- Needs Repair:** 243
- OK:** 3234
- Resurvey:** 3
- Unable to Locate:** 57

Below these KPIs, there is a section for 'Valves Exercised' with a bar chart showing 0 for Gate and 0 for Butterfly. A file explorer window is open over the map, showing a folder named 'Nepal' containing various files such as '220726 A...ment.docx', 'AWF.pptx', and several photo files. The map itself shows a geographical area with a red boundary and various asset markers. At the bottom, a bar chart titled 'Valve Operational Status - Needs Repair' shows the following data:

Type	Count
Gate	130
Butterfly	110
Others	3

Asset Management – Real Time Monitoring

- Nobel Systems provides its unique patented water quality/water level and pressure monitoring system
- This is based on the latest Internet of Things (IoT) technology
- This is an easy to install cellular battery powered device
- Pressure data is transmitted every three seconds in real time

IoT Plus Work Orders: Digital Twin in Action

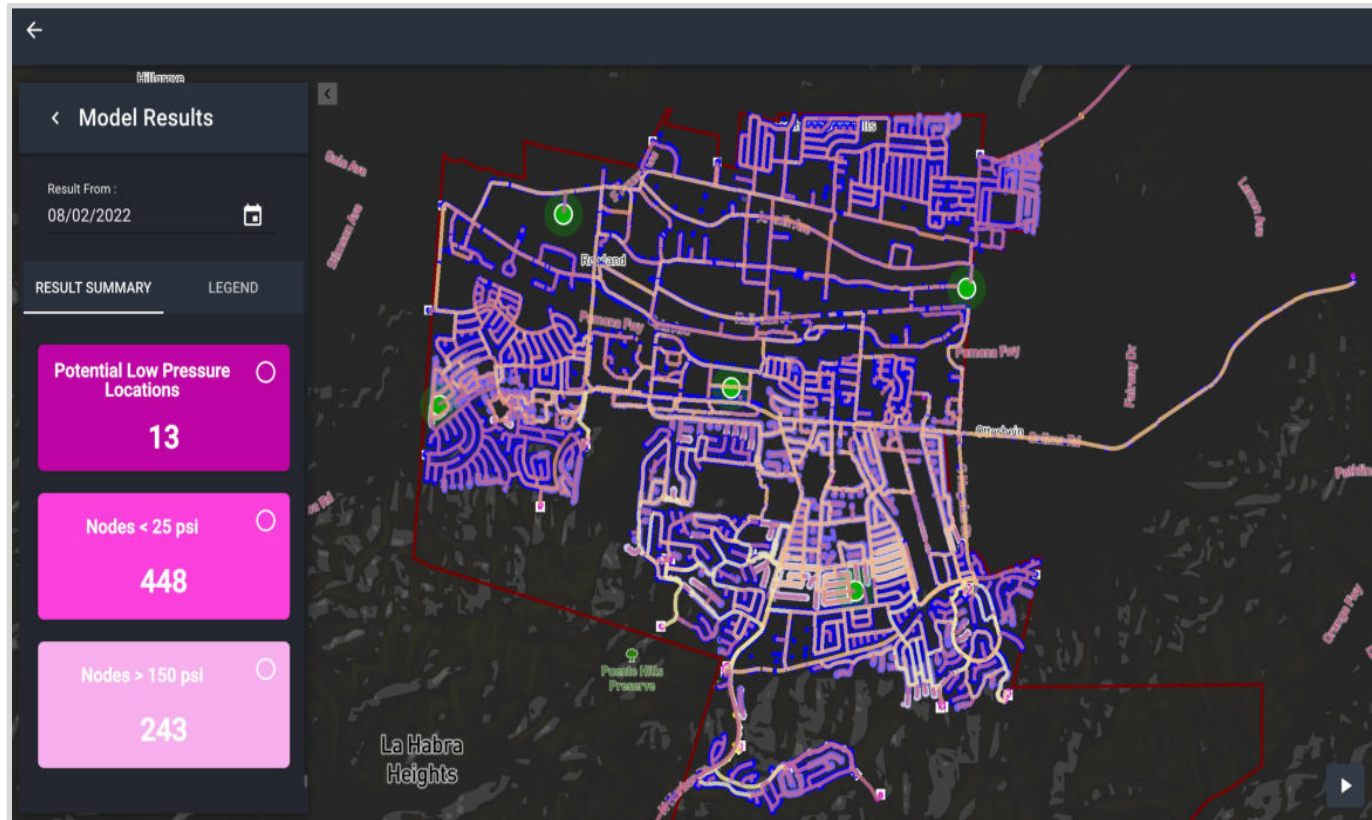

Real-time Asset Management: Latest Consumption & Production Trends

- Visualize all the asset data on GeoViewer
- GeoViewer integrates with AMI and SCADA to help provide useful insights
- Pipes, pumps, meters, and tanks can be monitored in single GeoViewer platform using this integration
- Get operational analytics to make effective asset decisions

Real-time Modeling: Integrate SCADA, Billing Consumption Data into Real-time Model

- GeoViewer creates a real-time hydraulic model to replicate each asset operations in real world.
- It is a digital representation of assets.
- Using the model, a user can create real-time scenarios for the following:
 - Mainline shutdowns
 - Demand changes
 - Flow analysis

GeoViewer: Your Asset Management Solution

GeoViewer answers key questions:

- ***What is the current state of my assets?***

Preventative Maintenance and GIS Data Collection will allow the utility to know all information about assets.

- ***How do my assets fail? What is the likelihood of failure?
What does it cost to repair?***

GeoViewer through its **Business Intelligence Module** can display cost of repairs, assets likely to fail, and asset age.

GeoViewer: Your Asset Management Solution

- ***What is the demand for my services from my stakeholders?***

We can build a **Digital Twin of your system** by utilizing a hydraulic model that is based on real-time consumption and production data.

- ***What is the likelihood of failure?***

Machine learning through data input from hydraulic modeling, SCADA, billing consumption and operational activities **can inform utilities which pipes are likely to fail in the future.**

- ***What are my best minimum lifecycle cost CIP and O&M strategies?***

GeoViewer allows utilities to track CIP and O&M costs in real-time. Utilities can then plan CIP Projects, keep track of those project costs, and update the conditions and attributes of the new assets.

GeoViewer: Your Asset Management Solution

- We can track how urbanization and climate change impacts operational activities.
 - ***How does the Flow Change?***
 - ***How does the Production vs. Consumption patterns change?***
- We can save hundreds of hours of time with tracking operational activities and labor hours.
- We can show all high-risk assets on the map and build custom Business Intelligence for the utility.
