Land Information System Main Elements and Components

Rationale

Urbanization is one of the biggest challenges and opportunities for developing countries to achieve resilient and sustainable economic growth.

The success of urban development and redevelopment is typically based on robust systems for assessing land values directly related to property tax (land taxation), which are systematic, professional and transparent.

Similarly, land use policies need to be aligned with infrastructure plans (such as plans for public transit). In essence, city leaders and policy makers should be better guided in the decision making process with a systematic and transparent land management system.
