Technology And Business Prospects

The World's Leading Large-area 3D Modeling Technology

- Large-area 3D Model Realization Technology
- Shutter Control Technology According To The Speed Of The Drone
- Drone Sensor Calibration Technology

Holistic Business Skills

- Possess The Ability To Manufacture And Operate Self-developed Drones
- Fully Automated Post-processing And Object Recognition Technology
- Wideband 3d-model Data Service Technology

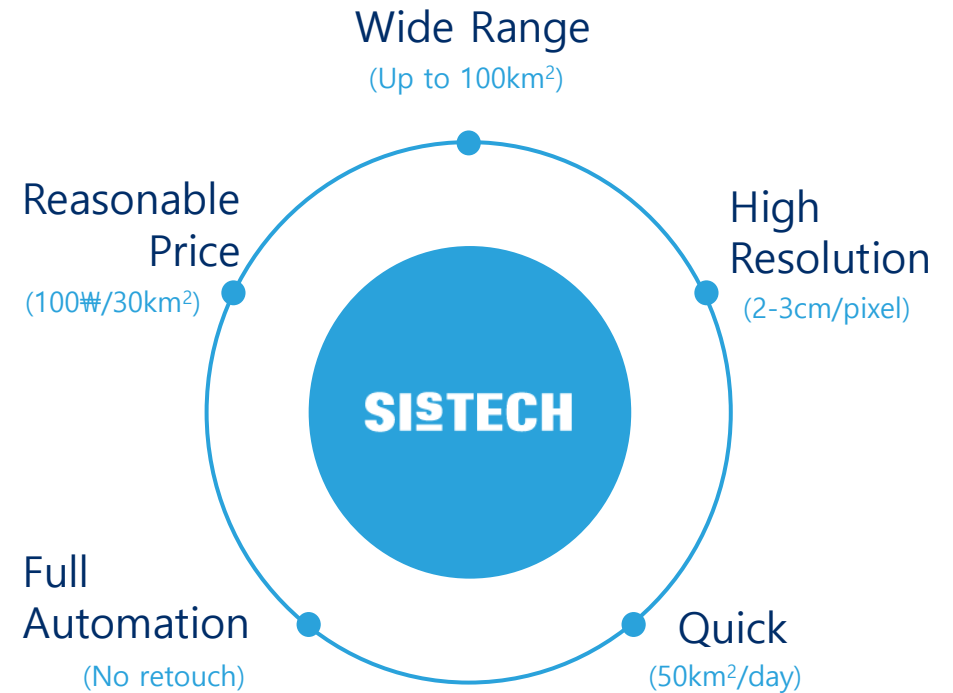

I . Features and Advantage of Service

City-scale (100km²) Immersive 3D Data Service

5 Advantages of Service

I. Features and Advantage of Technology

Self-developed Drones Provide City-scale 3D Model Data Services

Self-developed Drone Production & Operation Capability

01

Optimize Long-haul Flights

- Self-development and production of drones
- Drone swarm flight technology – 30 km² per 4 units at a time
- Up to 150 km per flight, up to 3 hours

City-scale 3D Modeling

02

Create a Wideband Range Model

- 200 km² 3D model of one plate
- Post-processing fully automated technology
- Object Recognition Technology

Broadband 3D Model Data Service

03

Expand Your Business by Providing a Variety of Services

- Providing market-tailored services
- Public information-based 3D model utilization service
- Time series analysis, safety management services, etc.

I . Technical Workforce Competence

A Team Of Business Execution Experts

3D Model Production and Development

01

3D Model Geospatial Information Specialist

General Manager.

Sungchang Hong

- 12 years of experience in 3D Model construction/geospatial data
- Former 3D model instructor at Bentley
- Surveying and Geospatial Information Engineer Qualification

Drone Manufacturing & Operations

02

Drone Systems Technician

CEO. Seongjin Park

- 15 years of experience as a fixed-wing/multicopter first-class operator
- 15 years of experience in 3D model data

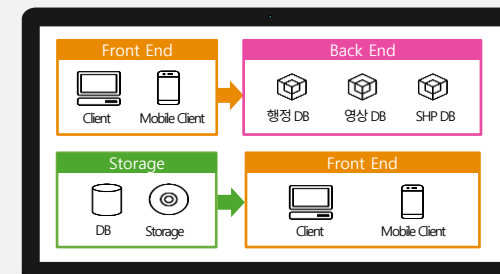

Drone Piloting Technician

Executive Director. Dubeong Son

- Fixed-wing/Multicopter Class 1 Operator
- 25 years of flight experience (over 2,000 flights)

Front/Backend Development

03

S/W Development Specialist

Executive Director. Sangsoo Yi

- 20 years of experience in spatial information/3D visualization development
- Registered 3 types of spatial information S/W

Data Development Specialist

Manager. Byeonghak Jang

- 10 years of experience in data Backend development
- Web Service Development Technician/Information Processing Engineer Qualification

Applicable Technical Matters

e.g. Daejeon City Drone Photography Plan

Shooting Plan with Consistent Quality through Terrain Flight

- Establish a shooting plan to have uniform quality with terrain flight considering elevation differences such as mountains and flatlands
- Establishment of a shooting plan that applies fixed-wing drones for rapid filming of city-sized areas

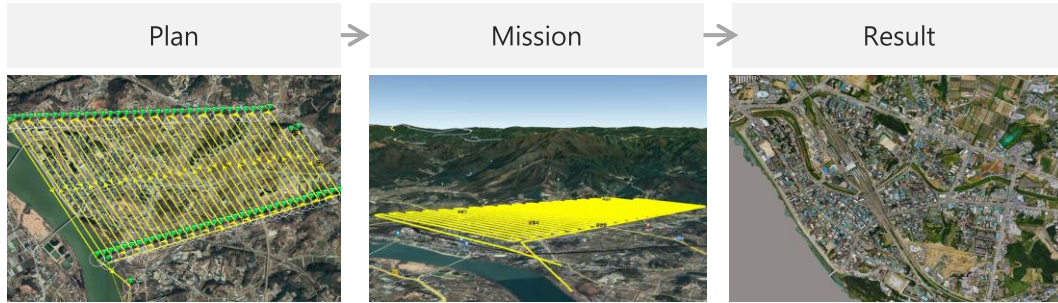

Shooting Plan to Minimize Occluded and Shadowed Areas

- Establish a shooting plan to express narrow alleys and minimize blind spots
- Considering the shadows, minimize the shaded area and establish a shooting plan

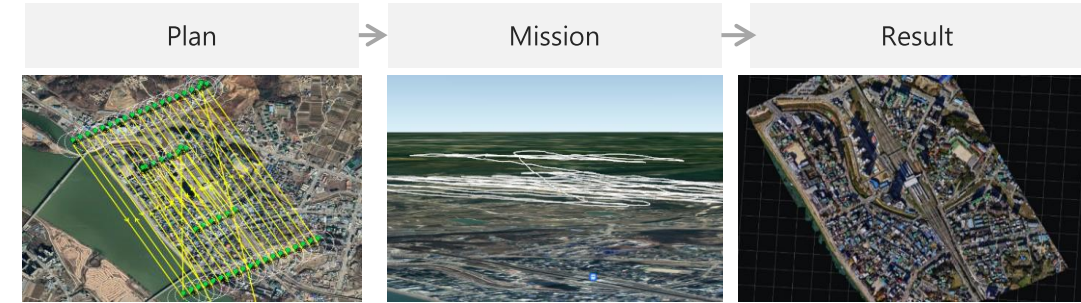

Applicable Technical Matters

Examples of Incorrect Shooting Plan

Examples of Improved Shooting Plan

Applicable Technical Matters

Drone Imaging with a Five-angle Camera for High-quality Deliverables

Double grid shooting using a single camera to shoot cross-strip

Single-grid shooting using a 5-Angle camera to shoot in a single strip

Benefits of this way

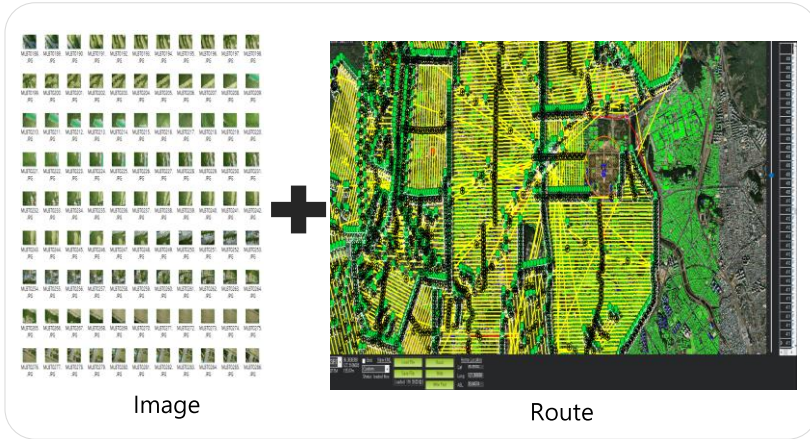

- It is possible to obtain a large number of photos compared to the shooting course
- Relatively in-depth filming, complete in one flight for all areas
- Easy to acquire slopes such as the walls of buildings

Rapid Drone Imaging through Large-scale Fixed-wing Swarm Flight

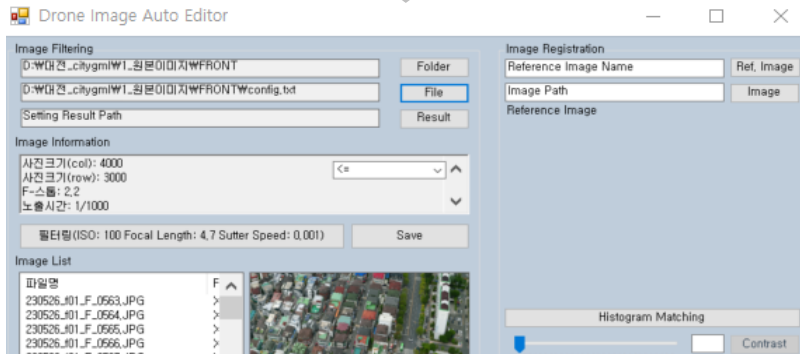

- For rapid large-area photography, multiple fixed-wing drones are flown at the same time to acquire data.
- Stable data acquisition even when flying multiple planes at the same time using the automatic airplane method

Applicable Technical Matters

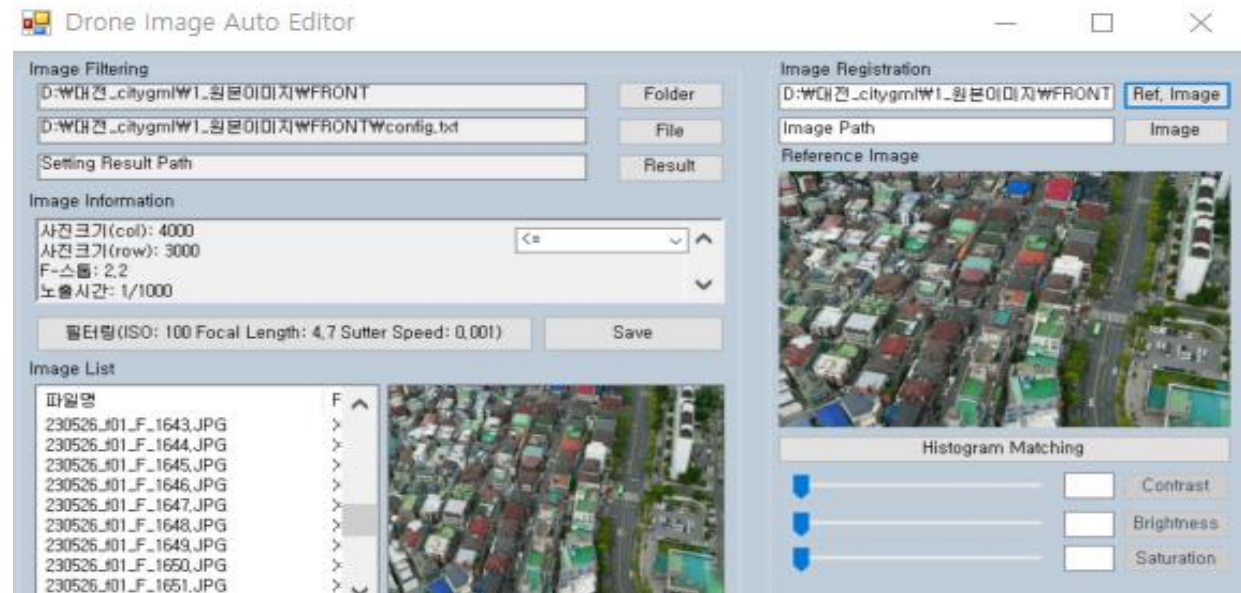

Geotagging

Self-produced video filtering S/W-based pre-processing

Optimize the Quality of the Original Photo with Filters and Color Correction

- Self-developed image filtering S/W-based pre-processing improves the quality of the original drone photo

Comparison of Auto-improvement Results and 3D Model Auto-production Results

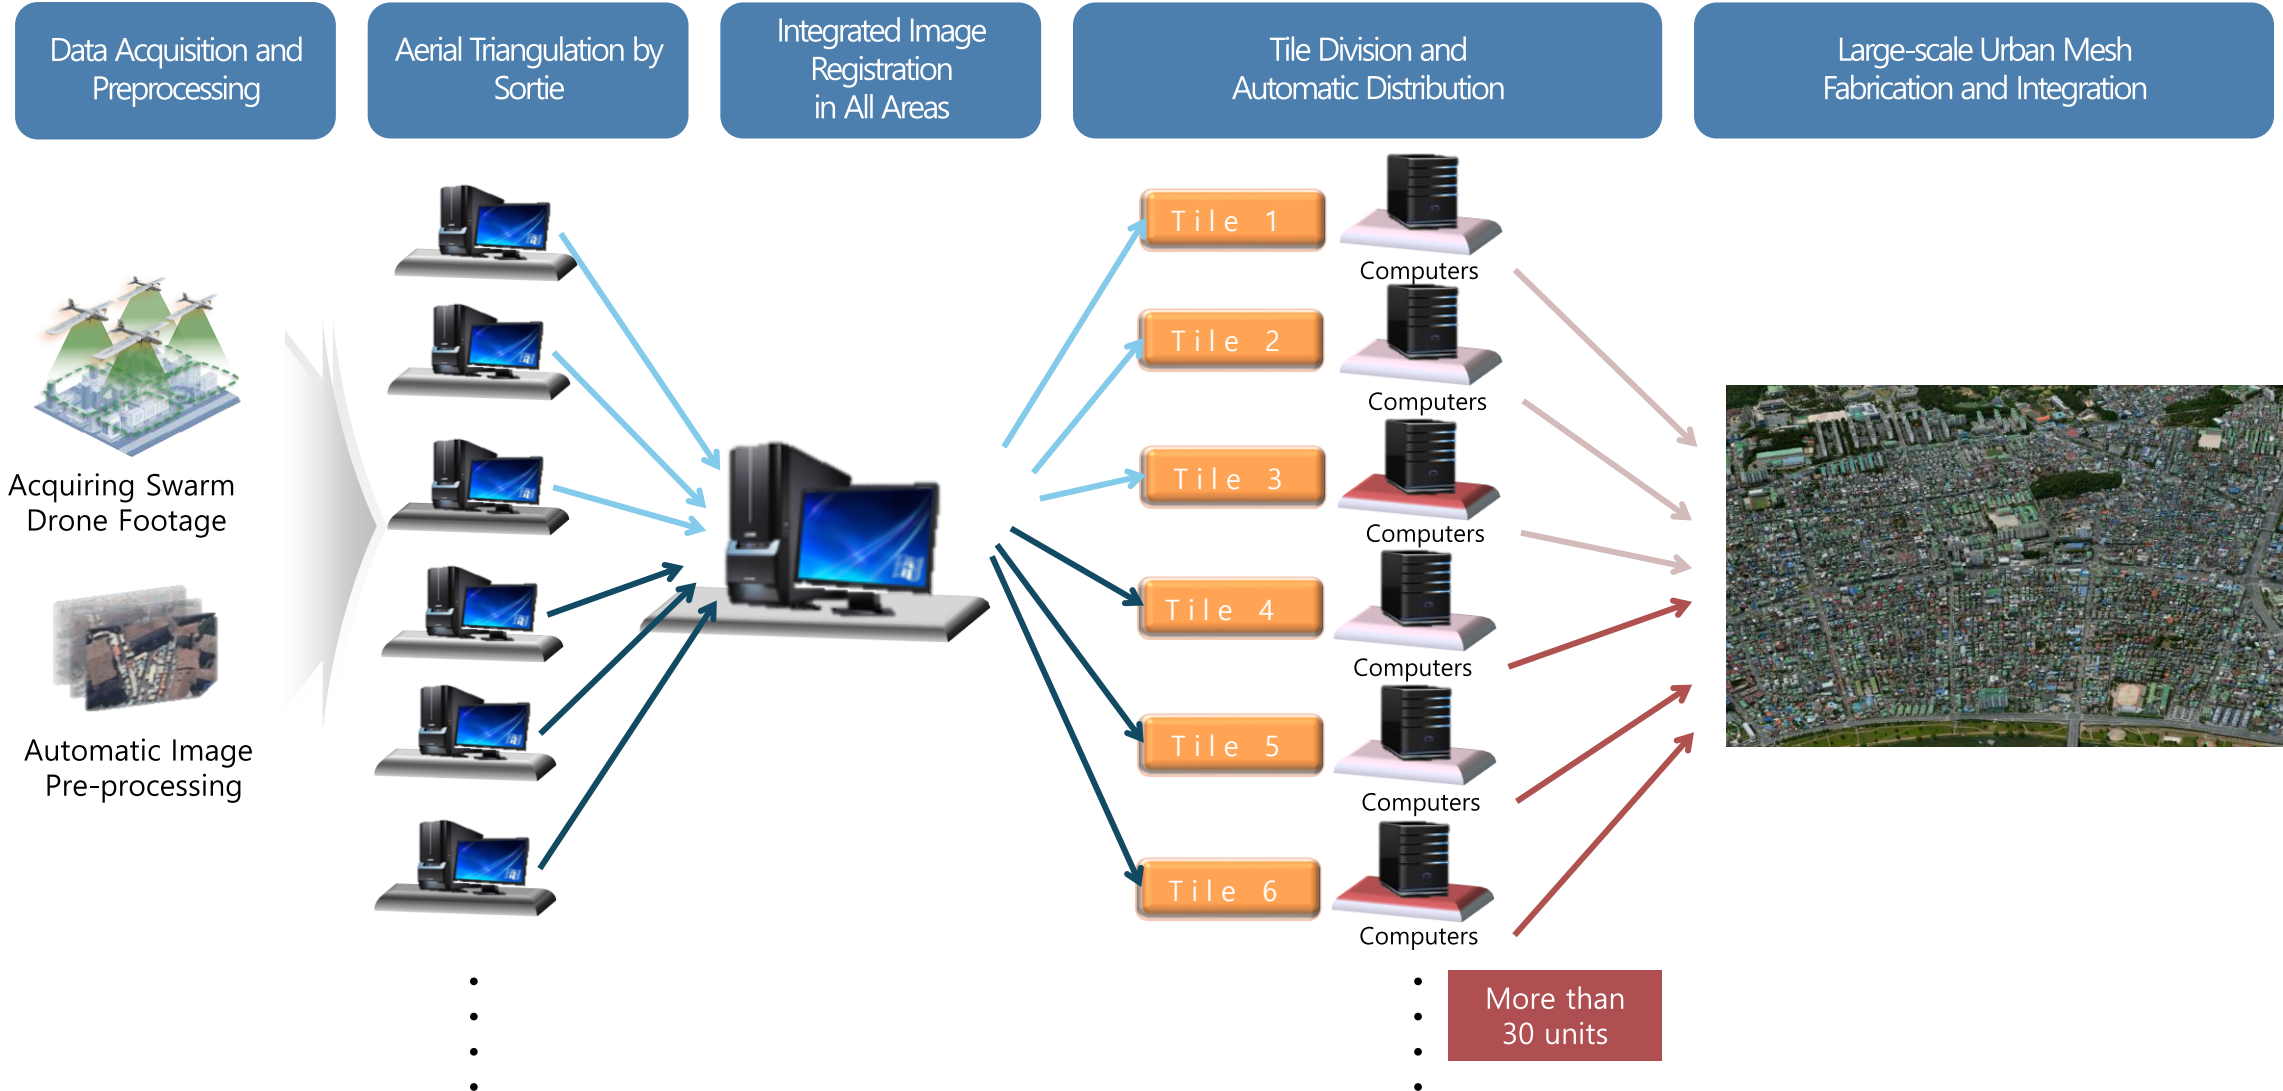

Improve Model Clarity

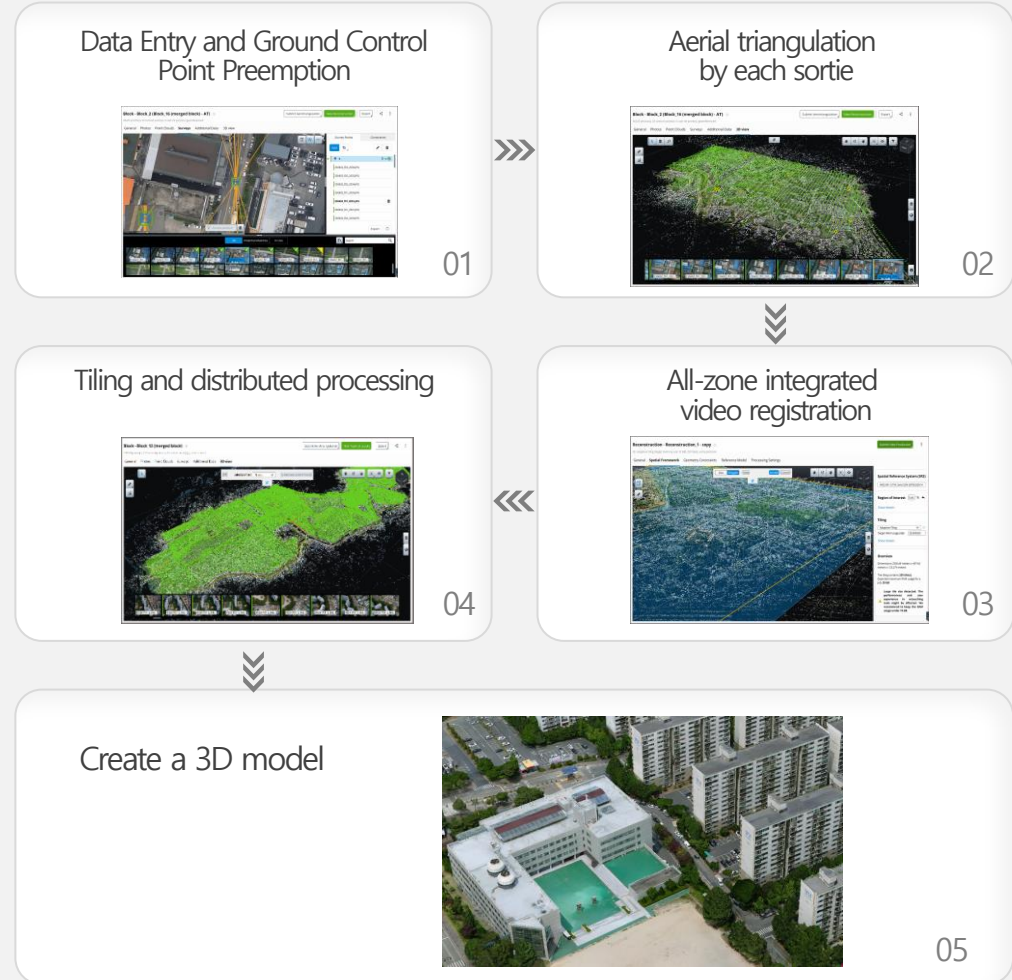

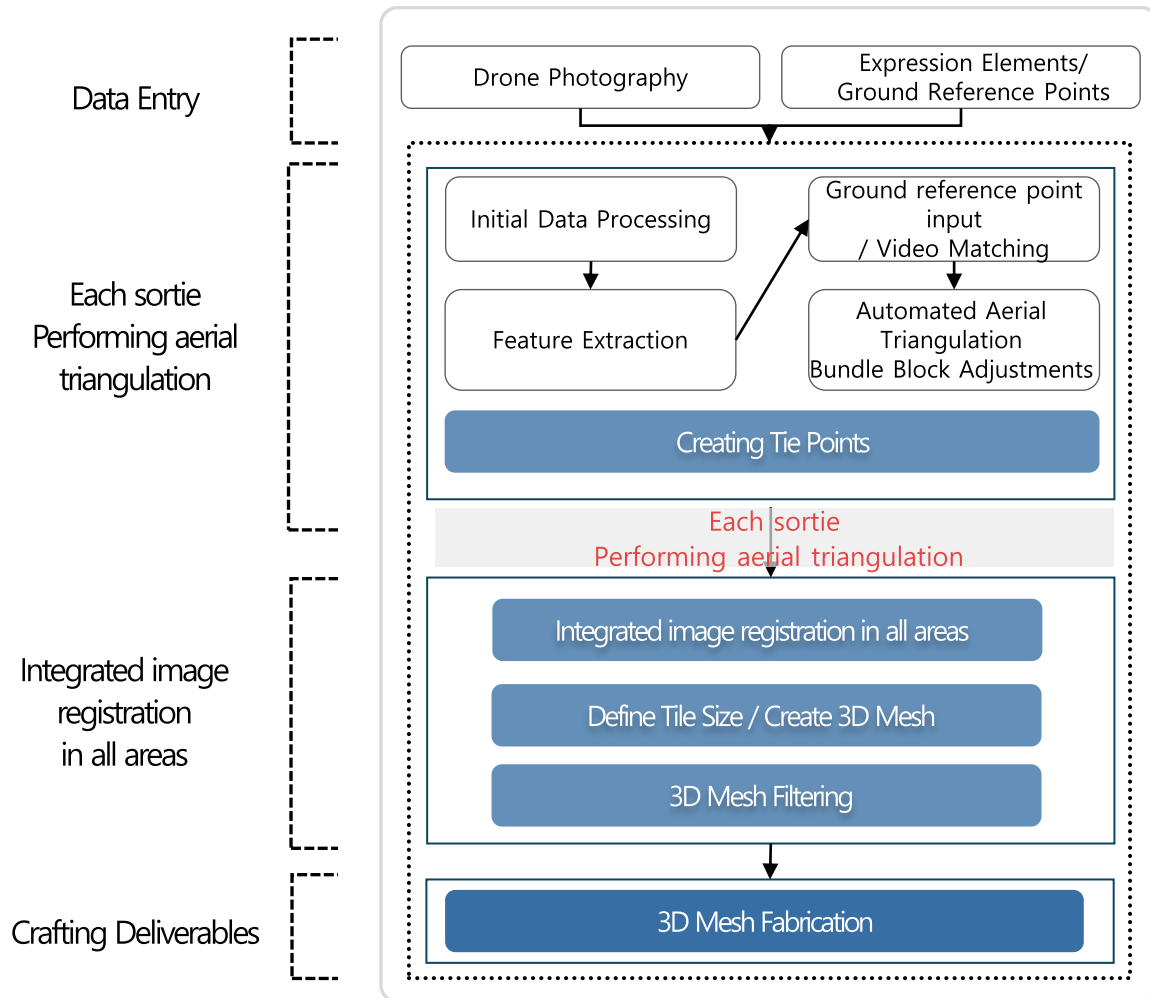

Improving the Quality of Automated Building Models

Distributed Processing Process for City-Scale 3D Mesh Model

Video Registration & Production Process

II. Production Steps - ⑤ Realistic 3D Model Production

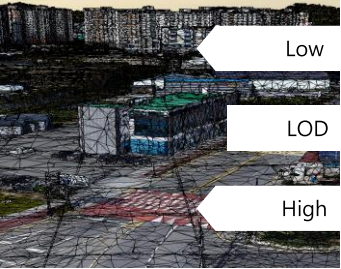

City-scale 3D Realistic Model

Large-Scale Regional Imaging
Acquisition and Utilization
Using Fixed-Wing Drones

III. Application Example

Building a 3D Surveillance Platform

Operation of Traffic Situation System

Drone-based High-resolution Precision Drone Traffic Model

Rural Customized Flood Damage Management Platform

Region-specific Crop Classification and Cultivation Area Survey

Administrative Services

3D Surveillance Platform

The 3D space of the 3D Control Platform enables the Realization of Realistic Scenarios and Simulators

3D Control Platform

- Enlarge the map
- Collapse the map
- Moving the map
- Three-dimensional rotation
- Receiving Event Signals
- Real-time check of video event alarms

Implement Scenario Features 02

- Emergencies are displayed and confirmed (e.g. Traffic accident)
- Executing contingency scenarios (e.g. Police car/fire truck)
- Status Reporting and Management (e.g. Situation Resolution Screen)

Implementing Simulator Functionality 03

- Vehicle Information Settings (Vehicle Type, Route, Property(excel/brake, Etc.))
- Pedestrian Information Settings (Type, Object, Event)
- Vehicle Information Verification (About Driving Settings, About Pedestrian Settings, Reset Function According To Verification Results)
- 3D Information Mapping (Suitable for vehicle routes 3D Static Object Information Mapping, Suitable for pedestrian locations 3D Static Object Information Mapping)
- Setting Execution Information (Execution Information, Timer, Execution Speed Etc.)
- Run the simulator

<p>01 Contingency Implementation</p> <p>In case of emergency, nearby CCTV control</p> <ul style="list-style-type: none"> (1) Display nearby CCTV footage (2) Move in the direction of the emergency point (3) Pen tilt control and situational information display 	<p>02 Implement Scenario Features</p> <p>Build at least 3 scenarios for the event</p> <ul style="list-style-type: none"> (1) Display of the location control of the driving vehicle (2) Sudden situation and normal situation control (3) Scenario layer on-off function 	<p>03 Implementing Simulator Functionality</p> <p>Running a 3D simulator based on setup information</p> <ul style="list-style-type: none"> (1) Vehicle Information Settings (2) Pedestrian information settings (3) Set simulator launch information

III. Operation of Traffic Situation System - Example

Application Example

Gongju City, South Korea

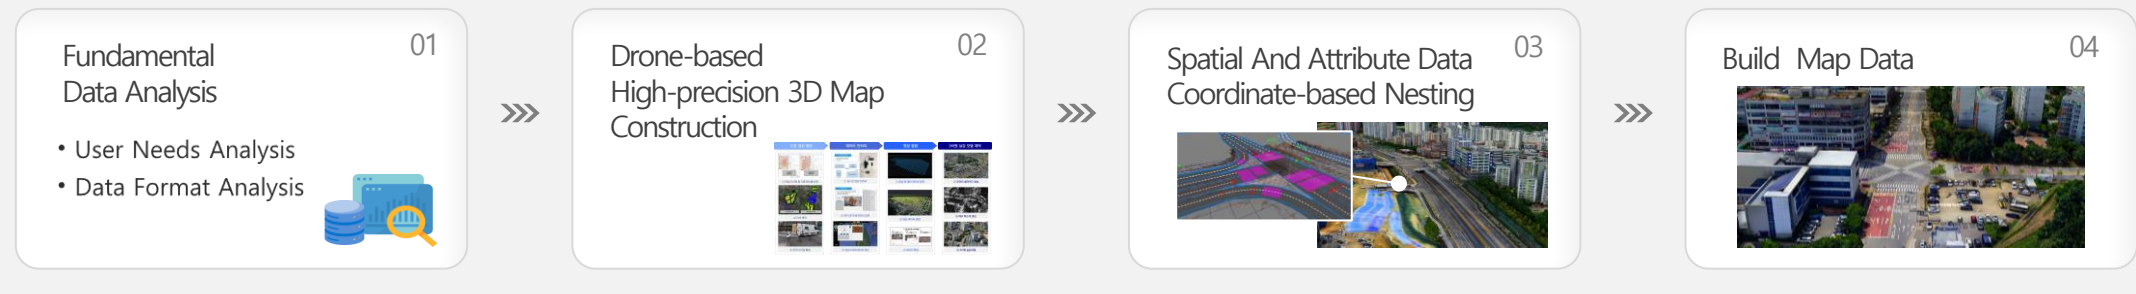

Drone-based High-resolution Precision Drone Traffic Model

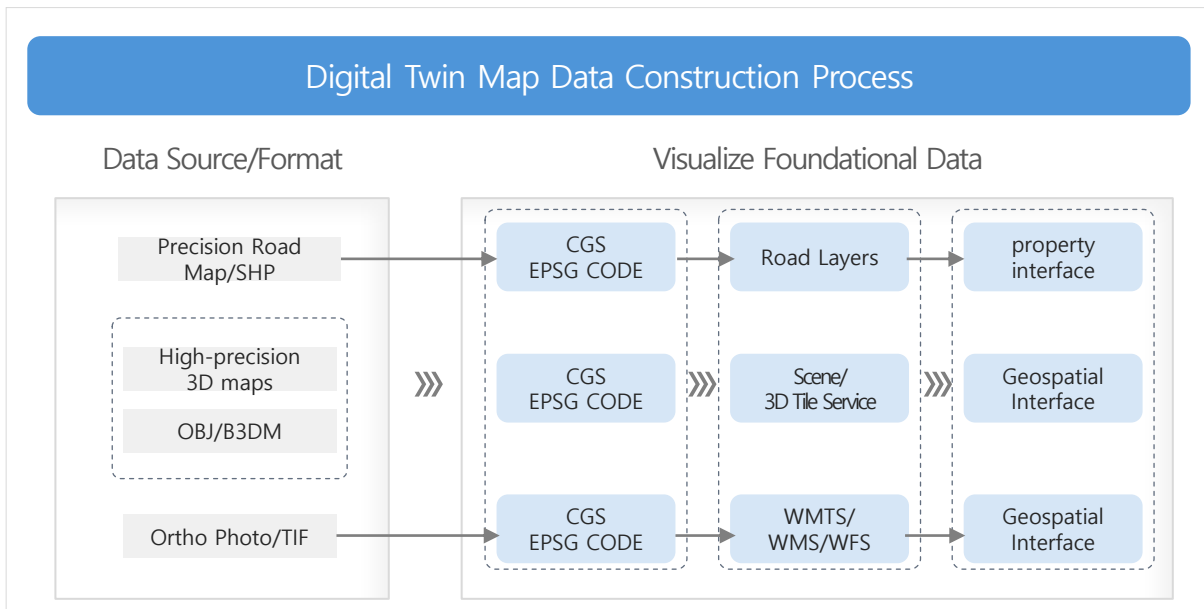

Drone Traffic Model

Drone-based High-resolution Highway Map Data Construction

Digital Twin Map Data Construction Process

Data Map Configuration: Classification and Visualization Scheme by Map Layer Topology

	Entry	Layer	Format	Content
1	Attribute Layers	Status boards, milestones, and other road structures and object attribute layers	SHP	Exists at the top of the topology
2	Precision Road Map Layer	Dynamic Objects	3DS (XPL)/DB	Traffic lights, vehicle signals, and other dynamic object layers and data
		Stop lines, lanes, crosswalks, center lines, traffic islands, etc.	SHP	Each layer is positioned individually without influencing the topology
3	3D POINT CLOUD	MMS-based point clouds (if required)	LAS	Sub-position for map layer representation with precision
4	3D MESH	3D Immersive Map Data	3d Tiles (b3dm)	Based on a 3D tilemap, it is located on top of the orthoimage in terms of topological relationship
5	Ortho Photo	Satellite, aerial, drone-based 2D tilemaps	PNG/GEO TIFF	Based on the lowest position in terms of topology

Example of building map data with data attribute-based precision

III. Drone-based High-resolution Precision Drone Traffic Model

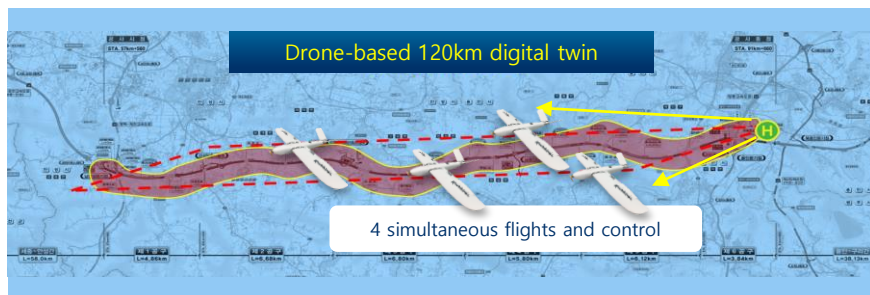

Long-distance drone use highway and coastline construction case

Drone-based High-resolution Precision Drone Traffic Model

Precision Road Traffic Model – Expressway

Demonstration section 120km 1 day shooting

1 team, 4 drones shooting at the same time

3cm-class high-resolution realistic image

You can check the road condition

Rural Customized Flood Damage Management Platform

Overview of Agricultural Infrastructure and Disaster Response Technology Development

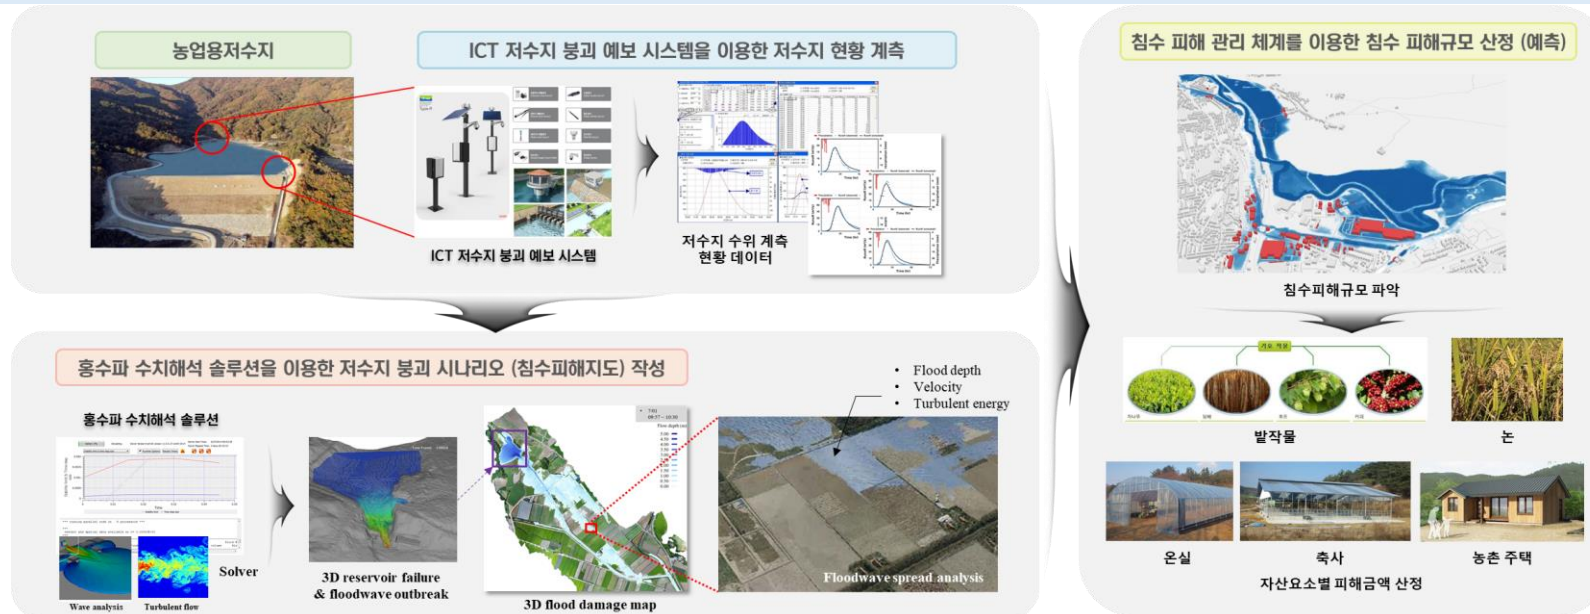

Project	Agricultural Infrastructure and Disaster Response Technology Development Project
Breakdown Business Name	Climate Change and Agricultural Disaster Response Technology
Central Administrative Agencies	Ministry of Agriculture, Food and Rural Affairs
Assignment Type	Designated open call for participants
Technical classification	Agriculture, Forestry and Food Environmental Ecology – Agriculture and Forestry Civil Engineering – Agriculture and Forestry Facilities
Project title	Development of ICT-based Flood Risk Management Platform for Rural Areas

R&D	Development
Principal Investigator	Won Choi (Associate Professor, Department of Regional Systems Engineering, Seoul National University)
Participating Researchers	Munseong Kang (Associate Professor, Department of Regional Systems Engineering, Seoul National University)
Co-Principal Investigator	Sangsoo Yi (Director, Sistech Co., Ltd.)
Service Research Officer	Soonyeon Kim (CEO, Hermes Co., Ltd.)
Period of study	2021.4.~2023.12.(2Y 9M) - STEP 1: 2021.4.~2022.12.(1Y 9M) - STEP 2: 2023.1.~2023.12.(1Y)

Rural Customized Flood Damage Management Platform

Overview of Agricultural Infrastructure and Disaster Response Technology Development

- ✓ According to the current status of the water level of dams and reservoirs, we present a reservoir collapse scenario
- ✓ The scale of flood damage includes the area of damage, depth of flooding, and property factors.

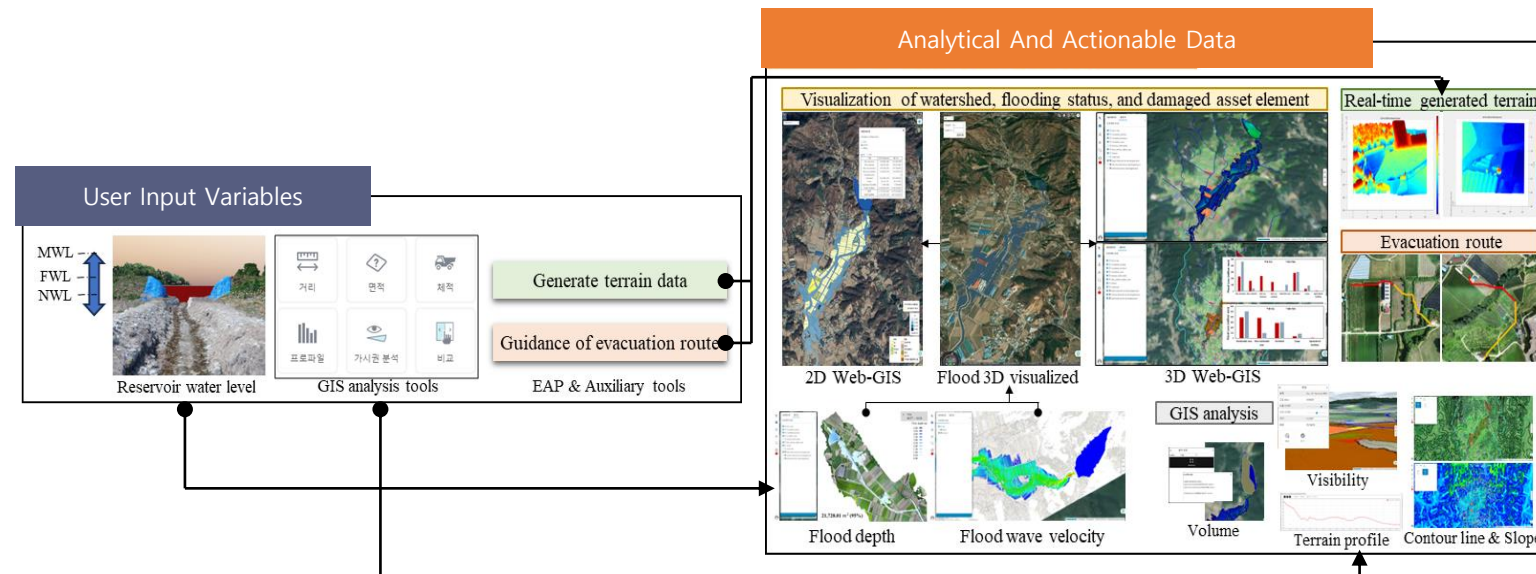

- **[Development Goal]** Focus on a disaster management analysis platform that can predict the scale of damage in the event of an agricultural reservoir collapse and establish a disaster response strategy
- **[Definition]** A system that gathers various data together and provides results quickly and easily through real-time analysis
- The **[User-friendly]** platform allows users to freely access information to analyze problems and establish efficient disaster management strategies.
- **[Improvement of Analysis Method]** Avoid the existing inaccurate analysis method and use the improved flood wave analysis method to establish the exact extent of the damage and evacuation plan
- **[Numerical analysis utilization]** Numerical analysis results such as flood damage area and flow velocity distribution can be used to prepare proactive response strategies

Rural Customized Flood Damage Management Platform

Overview of Agricultural Infrastructure and Disaster Response Technology Development

✓ Prototype Design

- **[Google Earth-based 3D visualization]** Configure existing geospatial data and Google Earth-based terrain to be interactive within the platform UI
- **[Web-GIS function]** Layer data such as satellite map and land cover can be used by overlapping with the flood risk
- **[Analysis of individual flood damage]** It is possible to calculate the amount of individual flood damage according to the desired asset type by sorting the land cover composition by asset elements according to the purpose
- **[Analysis of damage area by inundation time]** It also provides a function that can analyze the status of flood damage according to the elapsed time from the beginning of the reservoir collapse in 3D
- **[GIS Analysis Tool Support]** Use GIS analysis tools to calculate terrain slopes, distances, areas, volumes, and more

Rural Customized Flood Damage Management Platform

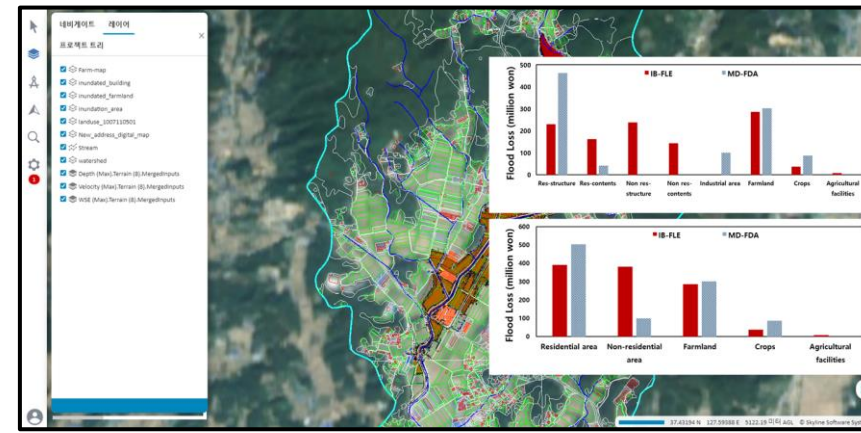

Overview of Agricultural Infrastructure and Disaster Response Technology Development

✓ Prototype Design

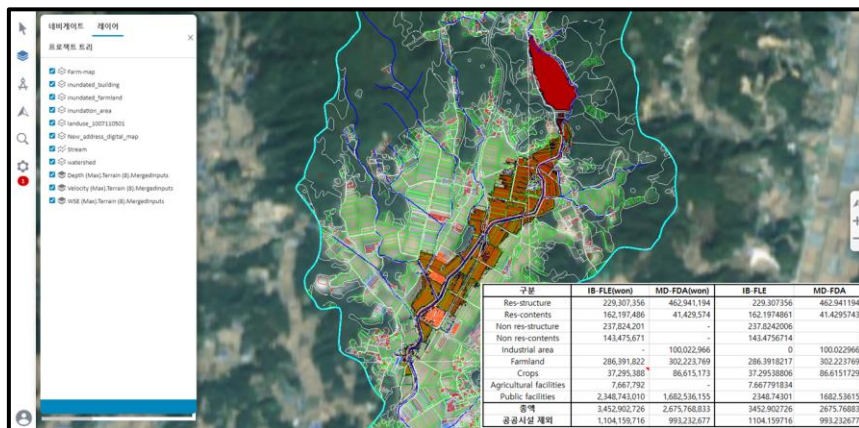

- Visualization - Analysis of flood damage by asset element

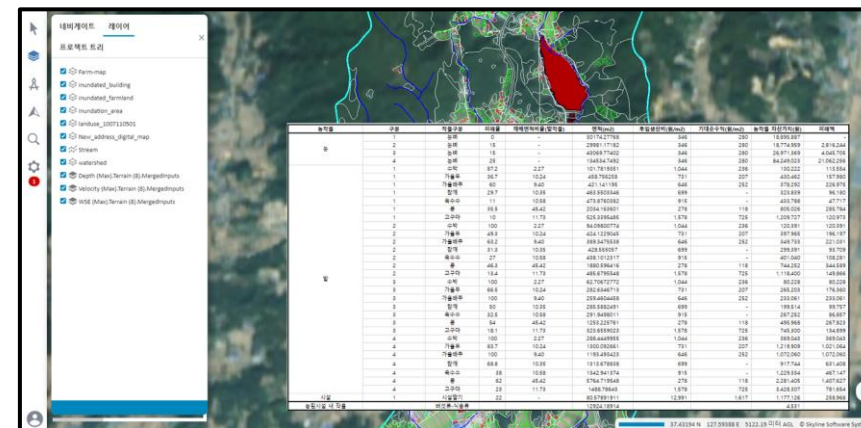

[Analyze satellite maps and land cover overlapping with the risk of inundation]

[Damage by Asset Element (Graph)]

[Damage by Asset Element (Table)]

[Amount of damage to individual crops (table)]

Rural Customized Flood Damage Management Platform

Overview of Agricultural Infrastructure and Disaster Response Technology Development

✓ Prototype Design – Additional Achievements

• Visualization – Enhancement Function

- 1) Using point cloud terrain data, a precision terrain visualization system is also piloted
- 2) Utilize LOD (Level of details) optimization techniques to effectively visualize large-scale terrain data
- 3) LODs are used when working with 3D models or scenes to balance visual quality and rendering performance, dynamically adjusting the complexity of objects
 - As the user's field of view gets closer to the object, a model with a higher level of detail (more polygons, more precise textures, etc.) is used.
 - Conversely, when an object moves away from the user, it is replaced with a model with a lower level of detail, reducing the rendering load
- 4) CAD and IFC (Industry Foundation Classes) data can be fused, enabling seamless sharing of building information during design, construction, and operation phases
- 5) It suggests that additional development is possible with a village-level BIM management model that manages flood-related disasters in advance, such as tourist attractions and landscape sites scheduled for construction that integrates flood damage analysis.

[Effective visualization using LOD optimization techniques (conducted by this research team)]

[Topographic data fused with IFC data (conducted by this research team)]

Expedited Reporting Targets

04 Images of analysis results and observations

Region-specific Crop Classification and Cultivation Area Survey

Crop Classification and Cultivation Area Survey

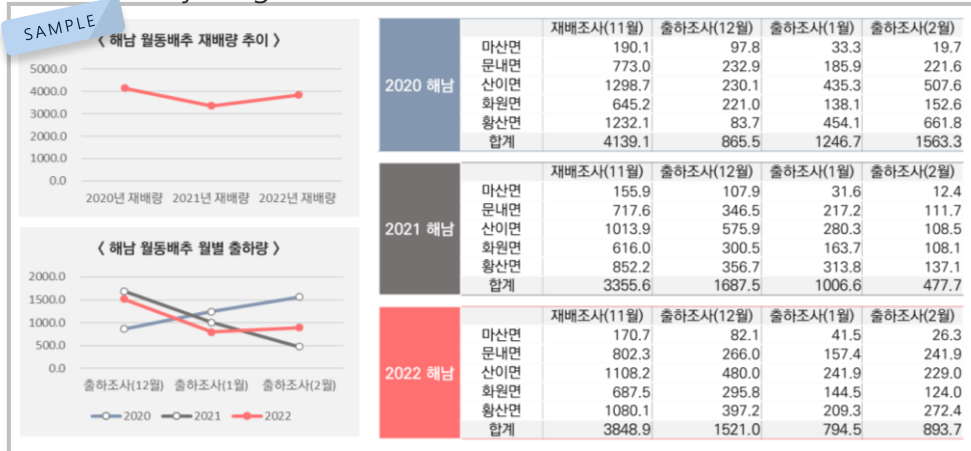

01 Distribution of winter vegetable cultivation using business results

02 Analysis of garlic and onion shooting sites using business results

03 Analysis of annual cabbage cultivation and shipping area in Haenam County using QGIS

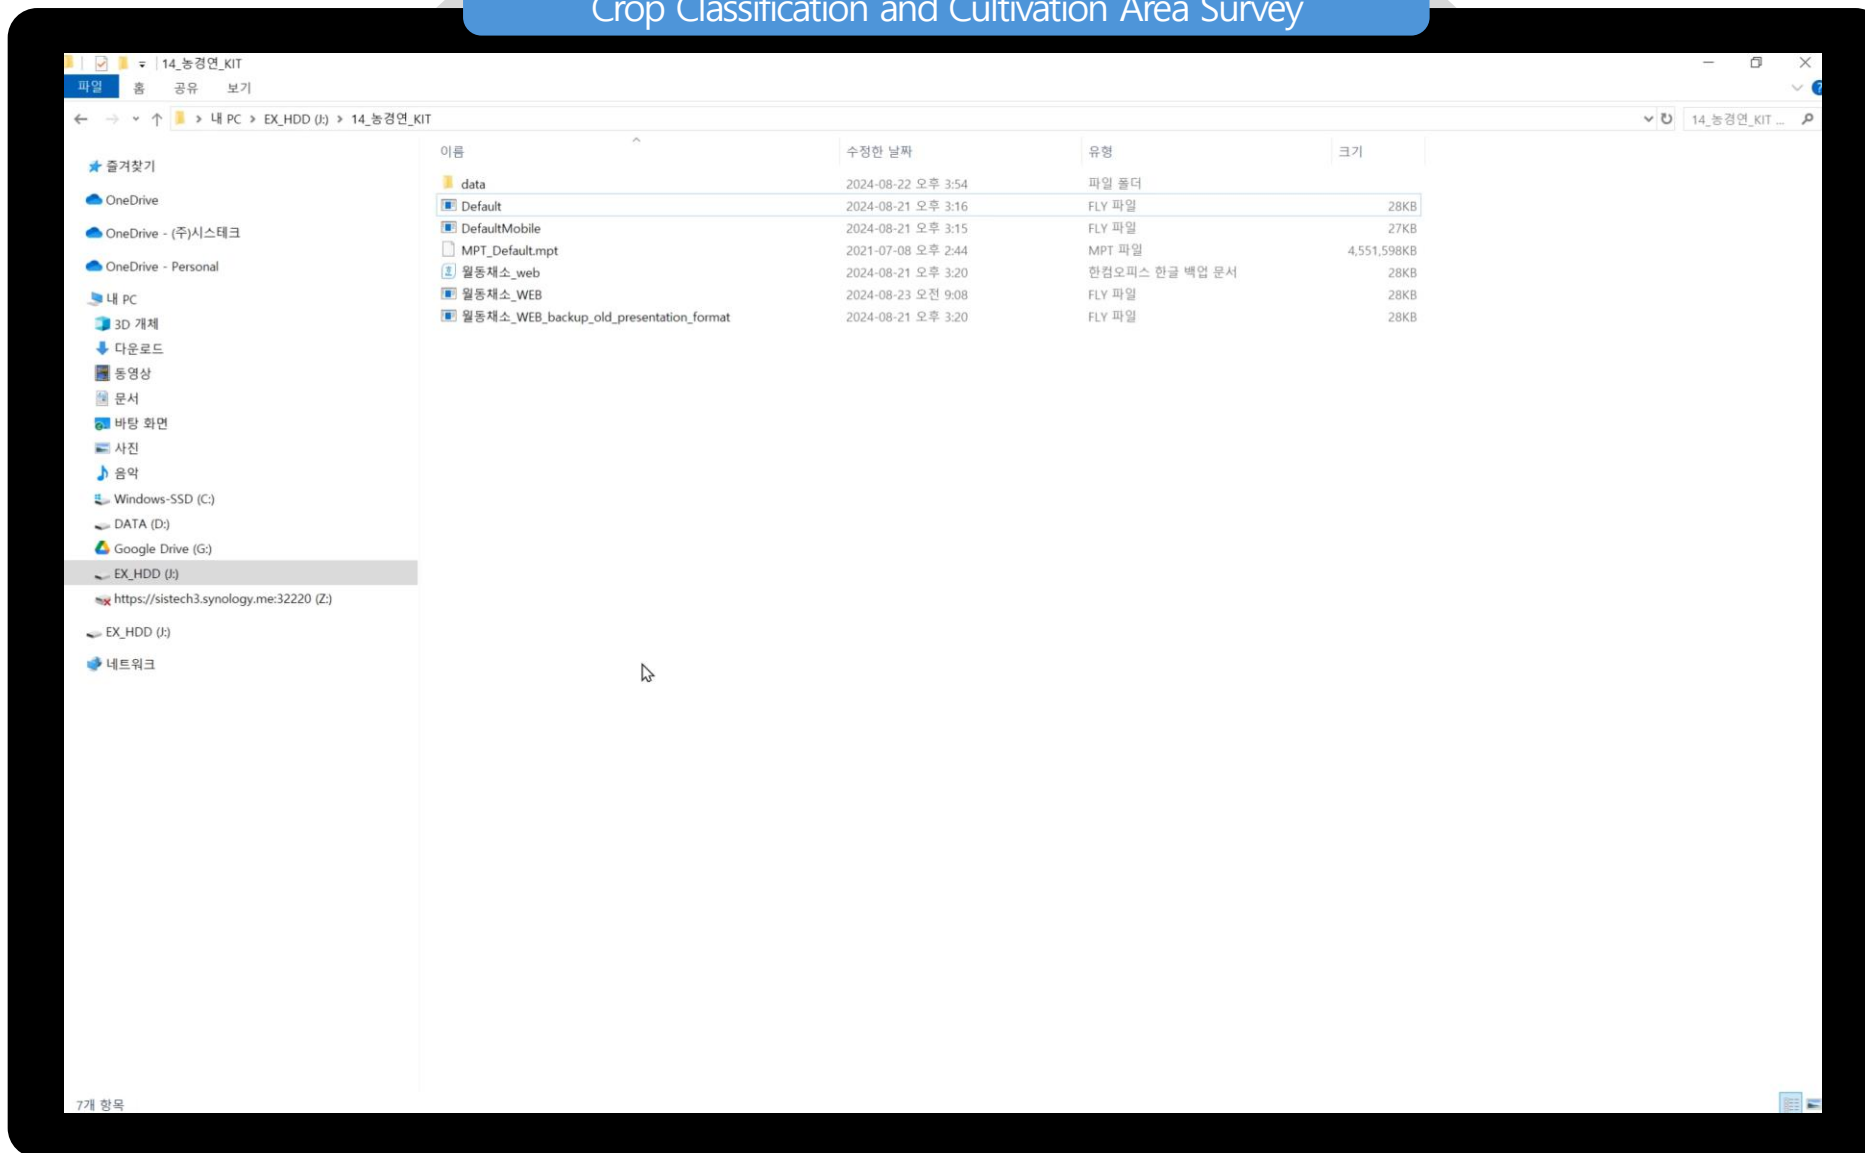

04 QGIS Cultivation Status of Haenam County Cabbage Series

Region-specific Crop Classification and Cultivation Area Survey

Crop Classification and Cultivation Area Survey

Administrative Services

2024 Drone Demonstration City Construction Project – Namwon City

City Model 3D Spatial Information and Attribute DB Construction

Create a 3D terrain basemap

- Namwon City Total 700 km²

Swarm Drone Mission Flight-Based Building Model

- Namwon City Center 100km²

Craft at least 8,000 DB building attributes and 5 DB attributes

- Building Information, Land Value Information, Building Name, Address Information, Site Shape

City Administration Utilization Service Establishment

Industrial Complex Digitalization and Administrative Services

- Visualization of industrial complex company portal linkage and attribute information
- Visualization of land use-based complex planning in the complex

Industrial Park Disaster Safety Management Service

- Establishment and utilization of industrial complex disaster damage information
- Visualization of CCTV in preparation for flooding

Basic S/W for using public information-based city model

- Urban administration utilization service basic S/W production

Vacant House Management Service

- Visualization of finding vacant houses for vacant house survey
- Namwon vacant house utilization support administrative support service

2024 Drone Demonstration City Construction Project – Namwon City

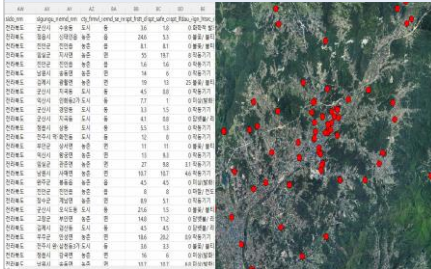

Namwon Building Public Information DB Production

Public Information DB Structuring

Construction of 8,000 buildings in Namwon

DB Attribution

Building information/Land value information/
Building name/
Address information/Site shape

Coordinate address information

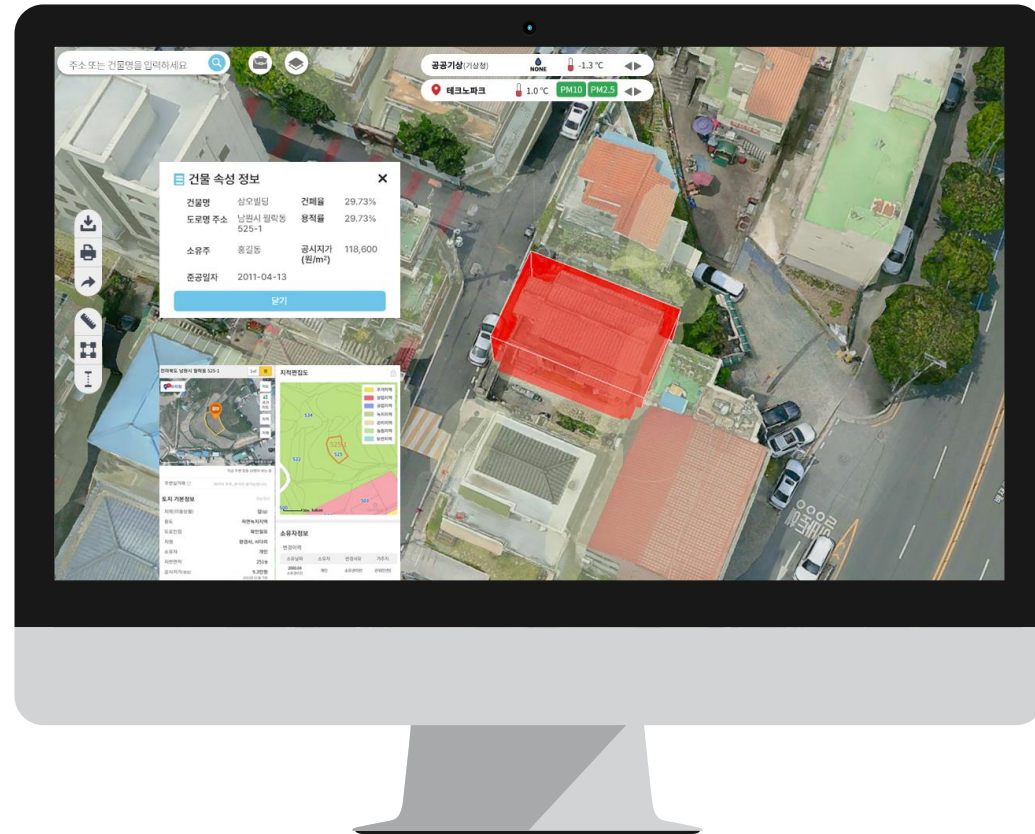

Construction by building address information

Spatial coordinates

Proceed with in-place editing

2024 Drone Demonstration City Construction Project – Namwon City

Vacant House Management Service

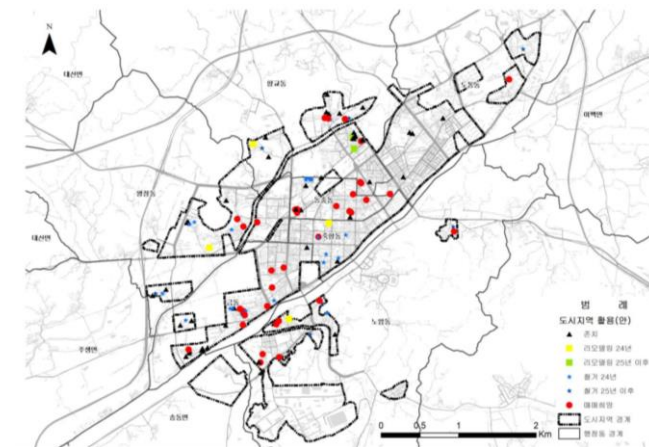

Linking address information and usage data

Visualization of target buildings in Namwon

Vacant House Demolition and Utilization Plan Example

CONTENTS

Large-Scale Regional Imaging
Acquisition and Utilization
Using Fixed-Wing Drones

IV. International Collaboration Project

Local Training and Application Cases
In Kazakhstan – Long Distance Highways

Local Training and Application Cases In Kazakhstan – Long Distance Highways

Technology transfer **completed**, Kazakhstan is producing the drone

Self-owned Drone Technology

Kazakhstan Drone Launch

Local Training and Application Cases In Kazakhstan – Long Distance Highways

Wide Area High Resolution
3D Model Data Set

Can Build 1,000km in 3 Days

1 Team Operating 4 Drones

High Resolution at 2cm

Crack, Porthole Aware

Compatible with CAD Drawings

Linking to Existing Drawings

Simultaneous inspection of road surfaces and
road facilities

Reduce Inspection Costs

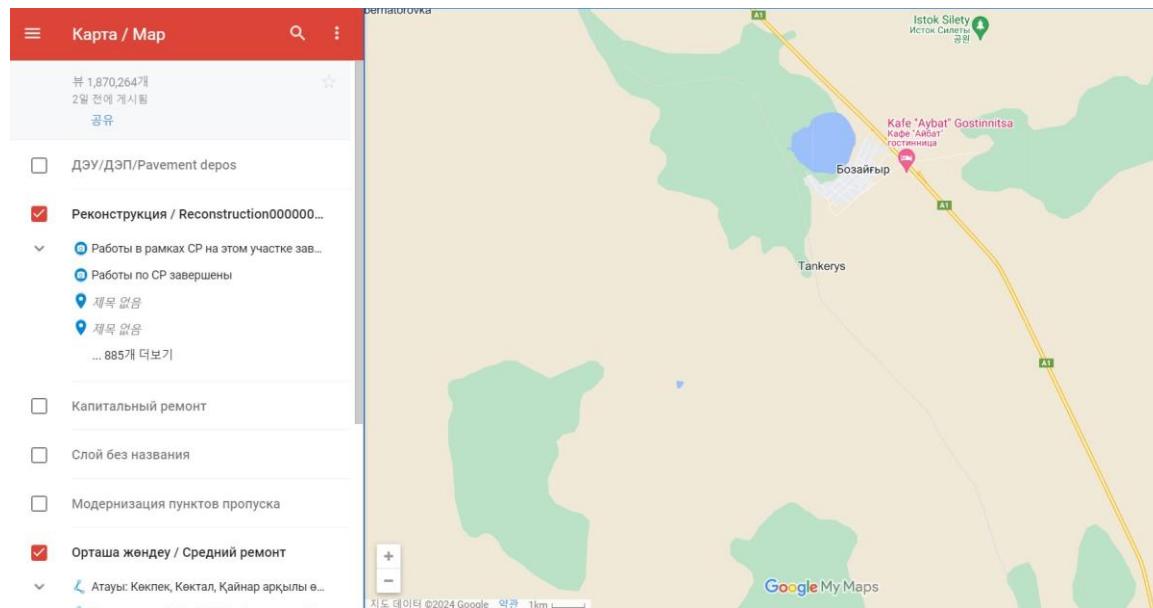

Local Training and Application Cases In Kazakhstan – Long Distance Highways

Google Maps-based Maps vs 3D-based Homebrew Maps

Relying on Google for map building timing

Build it yourself when you need it

Local Training and Application Cases In Kazakhstan – Long Distance Highways

Automated and Manual Creation of Road Maintenance Blocks

- Serializing Road Surface Management
- CAD Drawing Linkage Digitization(Manual/Semi-Automatic)

Crack Detection and CAD Drawing

- Crack Management Serialization/Crack Size Change Detection
- CAD Drawing Linkage Digitization(Manual/Semi-Automatic)

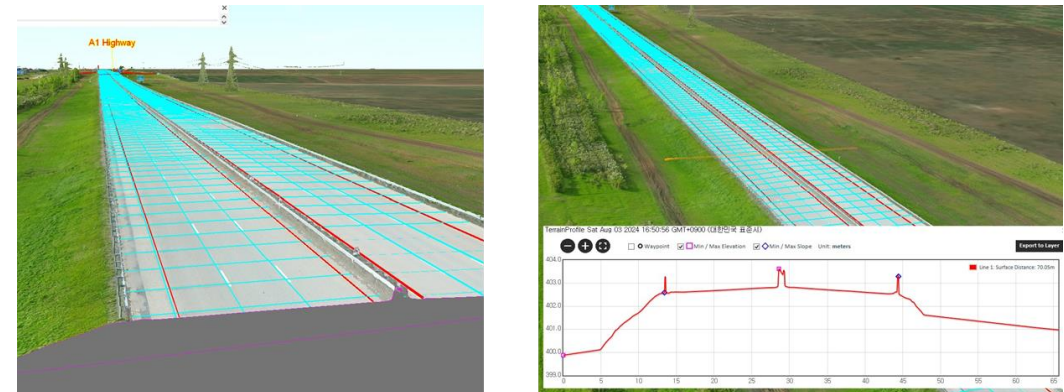

Check Roadside Billboards

- Billboard Maintenance (Serialization)
- Check Installation Status

Road Surface Cross-Section-Slope Analysis

Local Training and Application Cases In Kazakhstan – Long Distance Highways

On-site training Examples of Practical Flights

Thank you 😊
